MINIGLOSSARY CAPACITORS

Anode: One of two plates or conductors. In polarized capacitors, the anode should be connected to the positive conductor in the circuit.

Capacitive Reactance: The opposition (in ohms) of capacitance to the flow of alternating current, equal to the reciprocal of the product of the angular frequency (2π times frequency in Hertz) of the current times the capacitance in farads.

Cathode: One of two plates or conductors. In electrostatic capacitors the cathode is metallic. In electrolytic capacitors the cathode is a liquid, gel or other conductive material which is in intimate contact with a metallic cathodic connection.

Dielectric Constant: The ratio of the capacitance of a capacitor with some material other than air between the capacitor plates to the capacitance of the same capacitor with air between the plates. For example, the dielectric constants of air, Teflon®, polystyrene and ruby mica are 1, 2.1, 2.6 and 5.4, respectively.

Electrolytic: A capacitor with one metallic conductor (generally the anode) and with a liquid or semiconductor cathode. Nonpolarized electrolytic capacitors generally have two equal anodes as well as the liquid cathode. These anodes operate alternately as anode and cathodic connection as alternating current is applied.

Electrostatic: One of two general classes of capacitors in which two or more discrete metallic conductors are present and separated by an insulating dielectric material. Examples include: mica, ceramic, film, and paper types.

Farad: The basic unit of measure in capacitors. A capacitor charged to one volt with a charge of one coulomb (one ampere flowing for one second) has a capacitance of one farad. Capacitors are generally rated at portions of a farad (microfarads or picofarads).

1 farad (F) = 1,000,000 microfarads (μF) 1 microfarad (μF) = 1,000,000 picofarads (pF)

Impedance: All capacitors exhibit impedance. It is a function of capacitor type and internal construction. This can be particularly important in certain applications such as filters for switching power supplies. Capacitors used in these applications often have special multiple tab construction to shorten current paths and to reduce internal resistance.

Leakage Current: Expressed as dcl for electrolytic capacitors, a measure of the intrinsic losses in a charged capacitor. Generally speaking, the lower the dcl, the higher quality the capacitor.

Power Factor: A measure of the overall efficiency of a capacitor. Power factor ratings take all internal losses into consideration in a complex formula. This parameter of certain capacitors is often very important in AC applications such as motor-start and/or motor-run capacitors

Rated Voltage: The rated working voltage of a capacitor. Generally expressed in DC Volts (Vdcw). This is the voltage at which a capacitor may be safely operated at 25°C continuously within its overall parameters.

Ripple Current: The total amount of alternating and direct current that may be applied to an electrolytic capacitor under stated conditions. In general, the higher the ripple current applied, the shorter the operating life of the capacitor will be. Application of significantly higher than rated ripple currents can shorten the capacitor life dramatically and may even cause catastrophic failure (explosion).

Surge Voltage: The momentary surge voltage which may be applied for a stated length of time without doing permanent damage to the unit.

Temperature: Capacitors are generally rated at 25°C at sea level under specific humidity conditions. Operating temperature ranges are also given, along with derating (reliability) curves for operation at temperatures other than 25°C.

Temperature Coefficient: Expressed as TC in ppm (parts per million) or in percent (%) from the norm of 25°C. This is seldom a straight line and may vary widely for certain types. Most capacitors have positive TC in that the capacitance increases as temperature increases. Some types, however, have negative TC in that the capacitance decreases as temperature increases.

CAPACITANCE

Nominal capacitance expressed in picofarads (uF) by three-digit number, first two digits represent significant figures, last digit specifies number of zeroes to follow. When the nominal value is less than 10 pF, the letter 'R' indicates the decimal point and the succeeding digit(s) represent significant figure(s). For example: IRO indicates 1.0 pF; R75 indicates 0.75 pF and OR5 indicates 0.5 pF.

FAILURE RATE LEVEL

P = 0.1%
R = 0.01%
S = 0.001%
Expressed in % per 1000 hours

CAPACITANCE TOLERANCE

C = ±.25 pF
D = ±.5 pF
F = ±1%
G = ±2%
J = ±5%
K = ±10%

Metallized Polyester/ Metallized Polypropylene Capacitors

• Motor Run • Fans • Lighting • Power Supplies • Appliances • Pumps • Tools

General Description

Dielectric: Metallized Polypropylene (AD-P) or Metallized Polyester (AD-M) Film. Metallized Film is self-healing in the event of a momentary over-voltage.

Winding: Non-inductive using a zinc alloy spray to contact the edges of the metallized film.

Enclosure: Molded rectangular case of black polyester-glass which is flame retardant per UL94V-0. The integral mounting ear allows mounting of the capacitor to the chassis by a single screw.

Encapsulant: The epoxy compound used to fill the enclosure and protect the capacitor is flame retardant per UL94V-0.

Marking: Each unit is stamped with the Capacitance, Tolerance, Voltage Rating and Series Code.

Terminals: .187 or .250 Brass Terminals may be selected from several Style combinations. Solderable Lugs and UL 1015 Stranded Wire Leads are also available.

NEC SUPERCAP®—ELECTRIC DOUBLE LAYER CAPACITORS

SUPERCAP is a completely innovative type of capacitor providing a volumetric efficiency (capacitance per unit volume of a given voltage) of 10 to 50 times that of conventional aluminum electrolytic capacitors. The high capacitance (1 000 000 microfarads) and low leakage current makes the **SUPERCAP** an efficient, reliable, and cost effective energy storage device. **SUPERCAP** can be used as standby power sources for CMOS memories and microcomputers up to several weeks during power outages.

The **SUPERCAP** can be assembled on printed circuit boards by conventional soldering processes together with all other components. The **SUPERCAP** can be charged and discharged at both high and low current rates; i.e., microamps to amps.

MALLORY *sonalert® solid state signals*

AUDIBLE ELECTRONIC SIGNALS

- Solid State
- No Mechanical Wear
- Salt Spray Resistant

Electronically produces an audible tone when voltage is applied. Voltages from 1V to 250V may be used depending on the model. A piezoelectric transducer, operating substantially at resonance in a solid state oscillator, converts electrical power to sound, resulting in an efficient power conversion. Can be powered by many electrical sources, ranging from a single cell battery to industrial power lines. Because of low power requirement they can be turned on or off with a transistor, SCR, or integrated circuit. Temperature range: – 30°C to + 65°C. Some units will sound at voltages lower than minimum voltage specified.

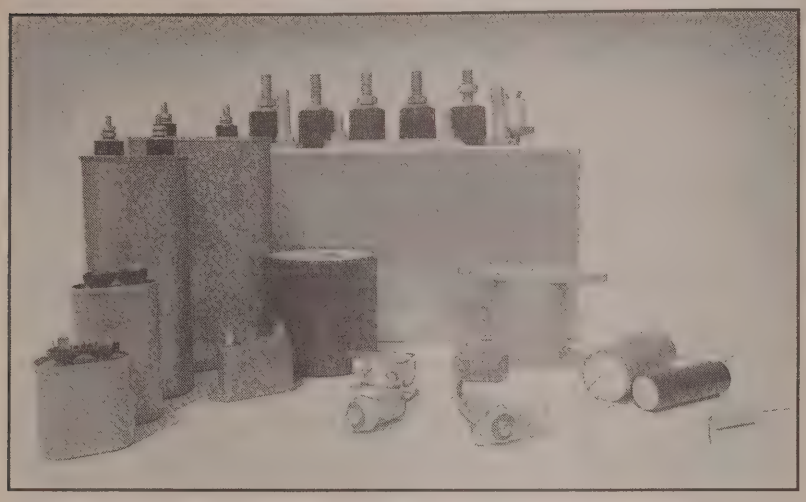
NWL ... the Source for Custom



A sampling of our diversified size and case capability.

NWL Capacitors . . .
Dedicated entirely to the design, production and marketing of high voltage custom oil-filled capacitors for the industrial community, NWL Capacitors has two facilities to serve your capacitor needs. Snow Hill, North Carolina, our newest facility and Riviera Beach, Florida. Either location you have the assurance of quality when you do business with NWL Capacitors because we are a division of NWL Transformers. In business for over 60 years, NWL employs over 300 people with an excellent reputation for manufacturing transformers, power supplies, reactors, chokes, and electronic controls.

All capacitors are 100% tested by a quality control inspector before shipping.

Engineering Excellence

NWL's engineering staff has over 60 years of cumulative engineering experience in the design and manufacture of industrial capacitors.

This experience tells us that for most applications a properly specified custom capacitor will perform better and provide long term cost savings when compared to "stock units".

Our engineers analyze every request and custom build each order to the customer's exact requirements.

Efficient computer-based design techniques plus a large and varied raw materials inventory, allows NWL to design capacitors specifically for your requirements, and deliver quickly.

Modern Equipment

NWL's production equipment is built to exacting specifications to support our engineer's design techniques. Multiple vacuum chambers allow all capacitors to be both dried and impregnated without being moved. We consistently achieve vacuum levels of less than 10 microns.

These techniques result in capacitors with superior mechanical form and higher corona inceptive voltages. All this means a longer, safer operating life.

Quality . . . Quality Assurance

Quality assurance personnel test each and every production capacitor according to customer requirements. This assures consistent high quality in every product shipped to the field.

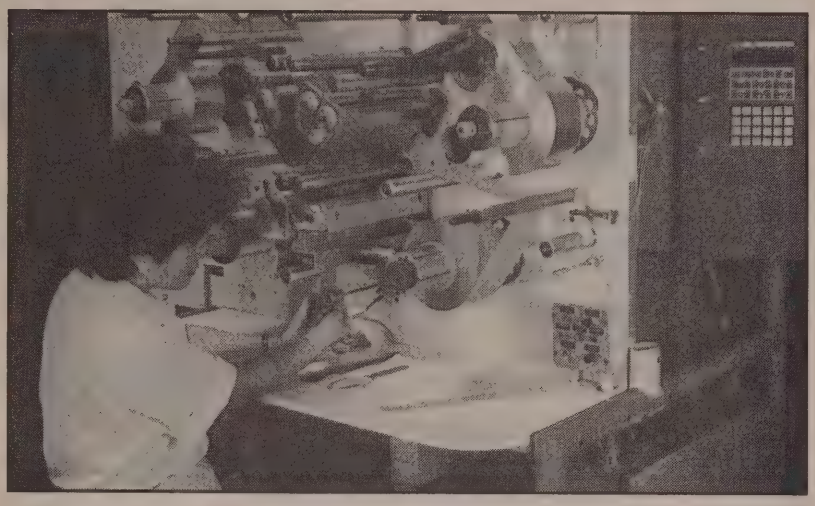
High Voltage Capacitors

Quick Delivery

NWL's deliveries are the best in the industry because:

- We maintain large inventories of foil and film in a wide variety of widths and thicknesses.
- Our custom-built high capacity film slitting machines means any film width we need is immediately available. Thus, our capacitor deliveries are not controlled by the lead times of our film suppliers.
- Sophisticated computer-based production control and material planning systems let us quickly and effectively review and adjust our schedules to meet customer requirements.



One of many winding machines that accept a wide variety of materials.

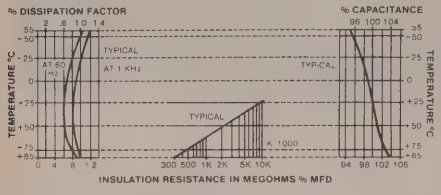
High Voltage Capacitors PERFORMANCE CHARACTERISTICS

DIELECTRIC:
A combination of plastic film and the finest grade of capacitor kraft tissue is used. Capacitors are impregnated and filled with the proper highly purified dielectric fluid. The closely controlled processing assures high reliability and prolonged life.

OPERATING TEMPERATURE
NWL High Voltage Capacitors are designed to operate over a temperature range of—55° to +85°C without derating.

CAPACITANCE
Measurements are made at a frequency of 1000 Hz. Standard tolerance for all capacitors in this catalog is ±20% at +25°C. Closer tolerances are available upon request. Capacitance change over the temperature range is shown graphically and does not exceed ±5%

DISSIPATION FACTOR
Dissipation factor is less than 1.0% at 1000 Hz +25 C (See graph)



INSULATION RESISTANCE
Terminal to Terminal: I.R. at +25 C is 10,000 MEGS x MFD minimum, but does not have to exceed 25,000 Megohms I.R. at +85°C is 300MEGS x MFD minimum, but does not have to exceed 2,000 Megohms. Terminal to Case: Where the case is not a terminal: I.R. shall exceed 10,000 Megohms at +25°C.

DIELECTRIC STRENGTH
Capacitors with ratings up to 10,000 VDC shall be tested at 200% of rated voltage. Capacitors with voltage ratings in excess of 10,000 VDC shall be tested at 150% of rated voltage. Terminal to case test, where the case is not a terminal, shall be performed at test voltage plus 1000 VDC. Duration of test shall be one minute and a resistance of one OHM/VOLT minimum shall be in series with the capacitor during test and discharge.

LIFE TEST AND EXPECTANCY
Capacitors shall withstand a life test of 500 hours at +85°C and at a voltage as per watt-second table below. One failure out of 24 samples tested is permissible.

Group I
Capacitors with: 5 watt-seconds and less
5.1 to 50 watt-seconds with capacitance less than 15 µf
51 to 200 watt-seconds with capacitance less than 5 µf
Life Test Voltage: 140% rated VDC
Life Expectancy: 4400 hours without derating at +85°C

Group II
Capacitors with: 5.1 to 50 watt-seconds with capacitance of 15 µf or more
51 to 200 watt-seconds with capacitance of 5 µf or more
201 watt-seconds and over with capacitance less than 2 µf
Life Test Voltage: 120% of rated VDC
Life Expectancy 3300 hours without derating at +85°C

Group III
Capacitors with: 201 watt-seconds and over with capacitance of 2 µf or more
Life Test Voltage 100% of rated VDC
Life Expectancy: 1800 hours without derating at +85°C

RIPPLE VOLTAGE
The sum of the peak AC voltage and the DC voltage shall not exceed the rated DC voltage. The peak AC voltage should not exceed: 25% at 60 Hz. 20% at 120 Hz. 8% at 400 Hz. 5% at 1 KHz.

ENVIRONMENTAL TESTS
NWL High Voltage Capacitors will meet requirements of MIL-C-25 and/or MIL-C-19978 wherever applicable.

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with the System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

PEC 831 Metallized Polyester Film

General Characteristics

The PEC 831 is manufactured using a unique packaging process which allows the production of a compact body size for a given capacitance. This allows the designer to specify an automatically insertable, axial lead capacitor allowing higher circuit board densities than were previously possible. The general characteristics of the PEC 831 make it an ideal choice for general coupling, decoupling and filtering applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 830 Polypropylene Film/Foil

General Characteristics.

The PPC 830 is an axial lead, polypropylene film capacitor that features small size, low price and flame retardant coating. The electrical stability of polypropylene and its characteristic high resistance to moisture allow these units to retain their original capacitance over long periods of time without degradation due to changing environmental conditions. The PPC 830 has the excellent characteristics previously found only in polystyrene capacitors but offers a higher temperature rating and, of course, flame resistance. The low negative TC and very low dissipation factor of the PPC 830 provide for a stable frequency response curve and high Q in resonant and filtering circuit applications. Since the PPC 830 also exhibits high insulation resistance (I.R.) and low dielectric absorption (D.A.), it is a good choice for storage and timing circuit applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 831 Metallized Polypropylene Film

General Characteristics

The PPC 831 is an axial lead, metallized polypropylene film capacitor featuring small size, high performance, low price and conformal encapsulation with a flame retardant coating.

The physical and electrical characteristics of polypropylene as a dielectric are commendable. Polypropylene is relatively impervious to moisture. It is also extremely stable. The PPC 831 will, therefore, retain its original properties over extended periods of time in a fluctuating environment.

Other noteworthy attributes of the PPC 831 are high insulation resistance (IR) and a low dielectric absorption (DA) factor. Both of these parameters are of critical importance in the selection of a sample-and-hold capacitor in data acquisition applications. The DA of polypropylene is about 10 times less than that of polyester and is significantly less than that of polycarbonate or polystyrene.

Also to be considered are the gently sloping curves for temperature coefficient (TC), dissipation factor (DF) and capacitance variation with frequency. The relatively flat response of the PPC 831 assures dependable, stable performance when incorporated into critical resonant and filtering circuit applications.

The "A" and "B" case sizes of the PPC 831 and PEC 831 style capacitors are computer designed with today's manufacturing and design criteria firmly in mind — namely, automation.

Until now, the most useful configuration for automated assembly, with respect to general bypassing, filtering and timing requirements, has been the box style capacitor. This is because the corresponding axial style devices are of physical proportions incompatible with automatic insertion equipment. Unfortunately, the box capacitor presents the modern factory with its own unique problems. An expensive radial insertion machine must be obtained. Box insertion requires an additional step in the assembly process which adds both direct and indirect production costs. In comparison, axials insert 3 times faster than radials.

PPD has been studying this situation for some time now. The culmination of this work has been the development of the "A" and "B" case film capacitors. The designer is now presented with the capability of specifying axial lead, automatically insertable, metallized film capacitors in the range of .001 µF to .27 µF. Examination of the dimensions of the "A" and "B" cases will reveal that, in length, they closely approximate the dimensions of RN55 and RN60 style resistors. Both "A" and "B" cases have a .177" ± .020" diameter. They can, therefore, be taped on 0.2" centers. Ultimately, these devices can be sequenced on standard axial lead insertion machinery to provide high volume, low cost production.

Our task is to choose the optimum materials and configuration to meet the specific electrical and environmental conditions of your system.

We, therefore, use a variety of quality film and tissue with the lowest loss characteristics to minimize heating effects. All capacitors are impregnated with the highest purity fluid, then completely filled in a hermetic envelope to increase the corona inception voltage to the highest level attainable.

When required we utilize oil expansion compensation devices to compensate for oil expansion at temperature variations. In extreme conditions fluid cooling may be required to thermally stabilize the assembly.

Our thirty years of experience in the design and manufacture of this family of capacitor is enhanced by our years of application experience in the various products we offer such as pulse forming networks and power supplies.

MINIGLOSSARY CAPACITORS

Anode: One of two plates or conductors. In polarized capacitors, the anode should be connected to the positive conductor in the circuit.

Capacitive Reactance: The opposition (in ohms) of capacitance to the flow of alternating current, equal to the reciprocal of the product of the angular frequency (2π times frequency in Hertz) of the current times the capacitance in farads.

Cathode: One of two plates or conductors. In electrostatic capacitors the cathode is metallic. In electrolytic capacitors the cathode is a liquid, gel or other conductive material which is in intimate contact with a metallic cathodic connection.

Dielectric Constant: The ratio of the capacitance of a capacitor with some material other than air between the capacitor plates to the capacitance of the same capacitor with air between the plates. For example, the dielectric constants of air, Teflon®, polystyrene and ruby mica are 1, 2.1, 2.6 and 5.4, respectively.

Electrolytic: A capacitor with one metallic conductor (generally the anode) and with a liquid or semiconductor cathode. Nonpolarized electrolytic capacitors generally have two equal anodes as well as the liquid cathode. These anodes operate alternately as anode and cathodic connection as alternating current is applied.

Electrostatic: One of two general classes of capacitors in which two or more discrete metallic conductors are present and separated by an insulating dielectric material. Examples include: mica, ceramic, film, and paper types.

Farad: The basic unit of measure in capacitors. A capacitor charged to one volt with a charge of one coulomb (one ampere flowing for one second) has a capacitance of one farad. Capacitors are generally rated at portions of a farad (microfarads or picofarads).

1 farad (F) = 1,000,000 microfarads (μF) 1 microfarad (μF) = 1,000,000 picofarads (pF)

Impedance: All capacitors exhibit impedance. It is a function of capacitor type and internal construction. This can be particularly important in certain applications such as filters for switching power supplies. Capacitors used in these applications often have special multiple tab construction to shorten current paths and to reduce internal resistance.

Leakage Current: Expressed as dcl for electrolytic capacitors, a measure of the intrinsic losses in a charged capacitor. Generally speaking, the lower the dcl, the higher quality the capacitor.

Power Factor: A measure of the overall efficiency of a capacitor. Power factor ratings take all internal losses into consideration in a complex formula. This parameter of certain capacitors is often very important in AC applications such as motor-start and/or motor-run capacitors

Rated Voltage: The rated working voltage of a capacitor. Generally expressed in DC Volts (Vdcw). This is the voltage at which a capacitor may be safely operated at 25°C continuously within its overall parameters.

Ripple Current: The total amount of alternating and direct current that may be applied to an electrolytic capacitor under stated conditions. In general, the higher the ripple current applied, the shorter the operating life of the capacitor will be. Application of significantly higher than rated ripple currents can shorten the capacitor life dramatically and may even cause catastrophic failure (explosion).

Surge Voltage: The momentary surge voltage which may be applied for a stated length of time without doing permanent damage to the unit.

Temperature: Capacitors are generally rated at 25°C at sea level under specific humidity conditions. Operating temperature ranges are also given, along with derating (reliability) curves for operation at temperatures other than 25°C.

Temperature Coefficient: Expressed as TC in ppm (parts per million) or in percent (%) from the norm of 25°C. This is seldom a straight line and may vary widely for certain types. Most capacitors have positive TC in that the capacitance increases as temperature increases. Some types, however, have negative TC in that the capacitance decreases as temperature increases.

Metric: $C = \frac{.0884\,K\,A}{t_D}$

II. Energy stored in capacitors (Joules, watt-sec)

$E = \frac{1}{2}\,CV^2$

III. Linear charge of a capacitor (Amperes)

$I = C\frac{dV}{dt}$

IV. Total Impedance of a capacitor (ohms)

$Z = \sqrt{R_s^2 + (X_C - X_L)^2}$

Where Rs = ESR

V. Capacitive Reactance (ohms)

$X_C = \frac{1}{2\pi fC}$

VI. Inductive Reactance (ohms)

VII. Phase Angles:

Ideal Capacitors: Current leads voltage 90°
Ideal Inductors: Current lags voltage 90°
Ideal Resistors: Current in phase with voltage

VIII. Dissipation Factor

$DF = \tan\delta\ (\text{loss angle}) = \frac{ESR}{X_c} = (2\pi fC)\ (ESR)$

IX. Power Factor

PF = Sine δ (loss angle) = Cos ϕ (phase angle)
PF = DF (when less than 10%)

X. Quality Factor (dimensionless)

$Q = \text{Cotan}\ \delta\ (\text{loss angle}) = \frac{1}{DF}$

XI. Equivalent Series Resistance (ohms)

$ESR = (DF)\ (Xc) = (DF)\ (\frac{1}{2}\pi fC)$

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage of 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathemtaical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287, Para. 3.12 when tested in accordance with Mil-STD-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

Steady pull of 5 pounds applied axially to leads for one minute. Bend test shall consist of one bend from the point of egress, first 90° in one direction, back to the original axial position, and then 90° in the opposite direction with no evidence of breakage.

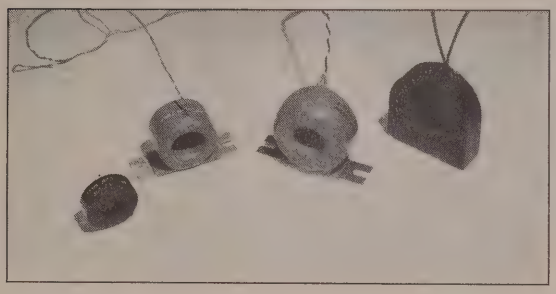
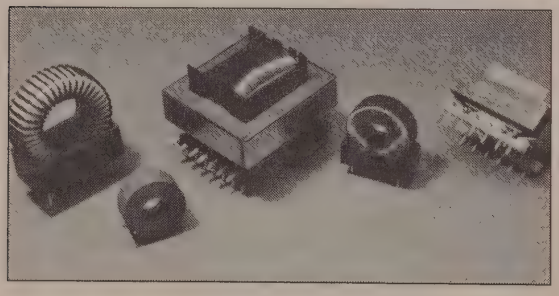
"Snap-On" 5-50A Load Detector

The LD-50 is ±3% accurate from 5A to 50A and can handle short term currents up to 150A! It costs a fraction of sensors with comparable range and accuracy *and* it's designed for pc-mounting and auto-insertion. And the LD-50 features a revolutionary snap-on design that simplifies installation – even in pre-wired systems!
New for '93: LD-100 10-100A detector.
Available Sept. '92. See pages A•1154 - A•1157.



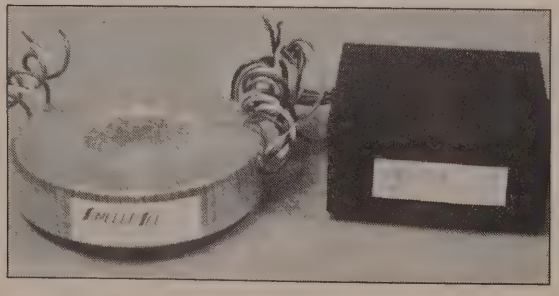
Toroidal Current Transformers

A complete line of CTs for current sensing, measurement and detection in controls and automation. For current-to-voltage and current-to-current applications.
Amecon CTs are smaller, lighter and more compact.
Three families are available: low profile/high accuracy; standard size/high accuracy; standard size/normal accuracy.
New for '93: electronic metering transformers.
See pages in this volume, section 5600.



Switch Mode Power Supply Transformers and Inductors

Current sense transformers, inverter transformers and filter inductors. A large selection of sizes are available, including miniature and low profile; in open winding, encapsulated and semi-encapsulated configurations. Custom designs to 200A. High frequency inverter transformers for power transistors and MOSFETs with power levels from 10VA to 1.0kVA covering frequencies from 5 to 100kHz with low power losses.
See pages in this volume, section 5600.



Toroidal Power Transformers

Low-noise, high efficiency power transformers are available with ratings from 10VA to 10kVA. In custom configurations and off-the-shelf models.
See pages in this volume, section 5600.

MOLDED RF COILS—SHIELDED
Coils are electromagnetically shielded with inductance values of .1μH through 10,000μH. Inductance Tolerances of ±5% are available by special request. Shielded coils reduce magnetic coupling between components and should be used only where coupling problems exist, since cost is normally higher.

LCR SERIES RF COILS
A unique series of inductors designed for overseas manufacturers who wish to eliminate problems when correlating inductance values of coils manufactured to Q-Meter specifications (according to U.S. military requirements) when they are measured on an HP impedance analyzer or LCR meter. Equivalent Domestic Use Part Numbers include: Series No. 1025, 1026, 1537, 1840, & 2500.

SURFACE MOUNT INDUCTORS

Coils are available in unshielded designs with inductance values ranging from .010μH thru 1,000 μH ± 10%. Shielded versions to reduce magnetic coupling between components are available from .010μH to 560 μH ± 10%. Closer inductance tolerances are available on special order.

Their rectangular outline package with symmetrical orientation is ideal for automatic indexing and assembly methods. Their parallel flat surfaces are well adapted to all methods of vacuum pickup and indexing. Coils can be supplied in bulk or reel tape.

Delevan/SMD components are compatible with all state-of-the-art attachments and soldering methods. Standard metalized ends are solder coated copper.

They are molded in thermally stable flame retardant epoxy resin. High temperature solder is used for internal joints to insure maximum reliability during assembly and attachment operations.

Our inductors are made in accordance with the basic requirements of MIL-C-83446 and are available on reel or bulk packaging.

* NEW power series available. Contact factory for latest brochure.

Many of the electrical parameters for new or prototype products have been calculated and are to be used for reference only. Please consult our current catalog or contact our factory when critical design data are required.

SMD Inductors are covered by U.S. Patent Nos. 4,801,912; 4,914,804 and 4,934,048

Laser marking is used to identify all SMD inductors

The addition of a Ferrite Bead to a piece of wire causes the impedance of the lead to increase and acts like a small RF choke at high frequencies. It is possible to dissipate high frequency parasitic signals and attenuate undesirable frequencies that travel on DC circuits by the use of beads.

NOTES:

1. Inductance: For 1.0 µH through 8.2 µH, effective inductance is measured at 7.9 MHz in accordance with MIL-C-15305. For 10 µH through 10,000 µH inductance is measured at 1 kHz.
2. Incremental current (INCR I) is the minimum current at which the inductance will be decreased by 5% from its initial (zero-DC) value because of saturation.
3. Operating temperature range -55°C to +105°C.
4. Marking: Color coded to indicate inductance value.

3. Incremental current (INCR I) is the minimum current at which the inductance will be decreased by 5% from its initial (zero — DC) value.
4. Dielectric Withstanding Voltage — 1000 VRMS.
5. Operating Temperature Range — −55°C to +85°C.
6. Materials:
   Coil Form — Ferrite.
   Magnet Wire — Type B per MIL-W-583.
   Jacket — PVC shrink tube.

HIGH CURRENT CHOKES

FOR SWITCHING REGULATORS AND POWER FILTERS

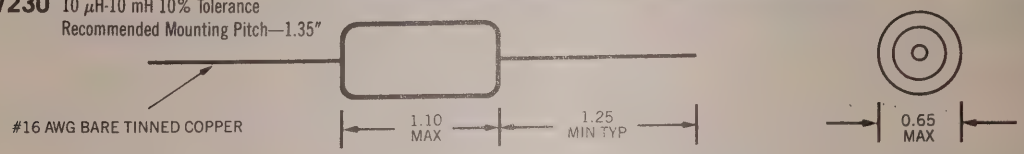
7230

TYPE 7230 10 μH-10 mH 10% Tolerance
Recommended Mounting Pitch—1.35"



NOTES:

1. Inductance measured on Cambridge Technology type 520 L/C Meter at 1 KHz.
2. The current rating (Rated IDC) is based on 0.75 watt power dissipation (I^2R) for an approximate 20°C temperature rise. Depending on the application, these units may be operated at higher currents.
   The core material for the 7230 series has been chosen for optimum current handling capability. Because this material has a relatively low volume resistivity, the core will appear as a shunt resistance on the order of 1 Kilohm, which may have to be taken into account when determining total power dissipation; e.g., if the induced voltage across the coil is 10 volts, there will be a V^2/R loss on the order of 0.10 watt, in addition to the I^2R losses associated with the winding.
3. The incremental current (INCR I) is the approximate current at which the inductance will be decreased by 5% from its initial (zero-DC) value because of saturation. If the current is increased beyond INCR I, the inductance will continue to decrease as shown by the saturation curve below.
4. Dielectric Withstanding Voltage: 1000 VRMS.
5. Operating Temperature Range: −55° to +105°C.
6. Marking: Printed with Caddell-Burns Part Number.
7. Materials:
   Coil Form: Ferrite
   Magnet Wire: Per FED SPEC J-W-001177/9
   Jacket: Flame Retardant PVC shrink tube UL Type FR-1 per MIL-I-23053

MINIATURE HIGH CURRENT CHOKES

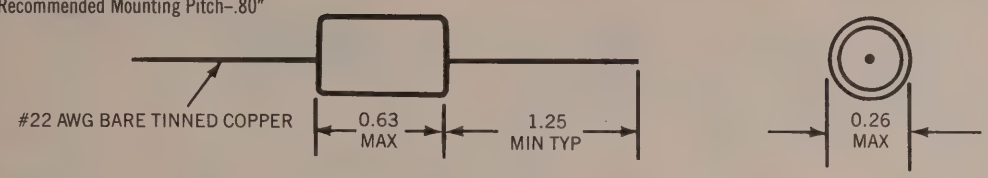
FOR SWITCHING REGULATORS AND POWER FILTERS **7300**

TYPE 7300 10μH–10mH 10% Tolerance
Recommended Mounting Pitch–.80"



NOTES:

1. Inductance measured on Cambridge Technology type 520 L/C Meter at 1 KHz.
2. The current rating (Rated IDC) is based on 0.25 watt power dissipation (I^2R) for an approximate 20°C temperature rise. Depending on the application, these units may be operated at higher currents.

   The core material for the 7300 series has been chosen for optimum current handling capability. Because this material has a relatively low volume resistivity, the core will appear as a shunt resistance on the order of 1 Kilohm, which may have to be taken into account when determining total power dissipation; e.g., if the induced voltage ($2\pi fLI$) across the coil is 10 volts, there will be a V^2/R loss on the order of 0.10 watt, in addition to the I^2R losses associated with the winding. This is not usually a factor unless the choke is operated at high levels of R.F. excitation.
3. The incremental current (INCR I) is the approximate current at which the inductance will be decreased by 5% from its initial (zero-DC) value because of saturation. If the current is increased beyond INCR I, the inductance will continue to decrease as shown by the saturation curve below.
4. Dielectric Withstanding Voltage: 1000 VRMS.
5. Operating Temperature Range: −55° to +105°C.
6. Marking: Printed with Caddell-Burns Part Number.
7. Materials:
   Coil Form: Ferrite
   Magnet Wire: Per FED SPEC J-W 001177/9
   Jacket: Flame Retardant PVC shrink tube UL Type FR-1 per MIL-I-23053.

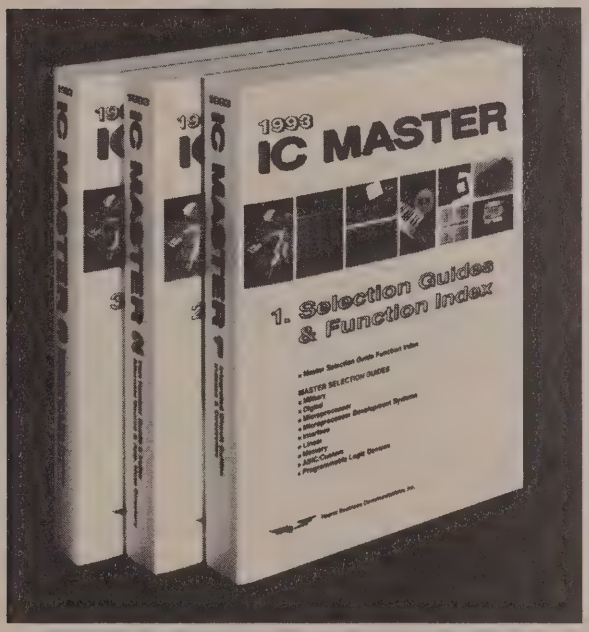
SSSSAVER TTIME SSSAVER!



Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

"SLOT 10" 10mm TUNEABLE RF COILS

These veratile Coilcraft variable inductors operate over a wide range of frequencies. Standard inductance values are available from less than 1 μH to over 1 mH. Custom values can also be provided upon request.

Coilcraft "Slot Ten" RF coils come in an international 10mm package. Their precision-molded slotted bobbins assure tight tolerances and high stability.

A variety of magnetic and electrostatic shielding options are offered. "Slot Ten" coils are tuned by means of ferrite or powdered iron tuning cores with a hex hole for easy, positive adjustment.

Coilcraft **Designer's Kit M100** contains 18 shielded and 18 unshielded coils (3 each) plus extra cores and sleeves to create all of the standard values shown. To order, please contact Coilcraft.

SELECTION GUIDE

Coilcraft "Slot Ten" coils come in five different styles. Consult this table for the inductance range, relative Q, and shielding options of each style. Then use the appropriate specification chart to pick a specific part number.

Style	L (μH)	Electrostatic Shield	Magnetic Shield	Recommended Frequency	Tuning Core	Relative Q	Relative Cost
Style 1	.8 — 624	No	No	Higher	Iron	Hi	Low
Style 2	.8 — 927	No	No	Higher	Ferrite	Hi	Low
Style 3	.7 — 450	Yes	No	Higher	Iron	Low	Med
Style 4	.8 — 624	Yes	Yes (Iron)	Lower	Iron	Med	Hi
Style 5	.9 — 1143	Yes	Yes (Ferrite)	Lower	Ferrite	Med	Hi

1 All readings taken on H.P. 4342-A Q Meter.
2 L min is achieved at maximum extension of the core toward PC board. Complete tuning range is reached within the boundaries of the coil form.
3 All specifications are recommended at standard "Q" meter frequency as a simple way to assure the quality of our parts. L and Q readings will vary with frequency change.
4 Unshielded parts are coated with lacquer to protect the winding.
5 Shielded parts have a sleeve insert to protect the winding.

High Q Coils for HF

Part No.	L nom µH	L range µH	Q @ L nom	F Test MHz	Fo @ L nom MHz	NOTES
Q3-.10	.10	.085-.115	95	25	650	The inductance adjustment range of Q3 type coils was deliberately stated below the attainable values by mechanically adjusting capability, in order to keep Q variations below 7%. Of couse a larger adjustment range is possible if Q variation is not of great importance to the circuit. Inductance and Q of the HF coils were measured on the HP 4324A Q meter. Data was obtained by the use of soldered leads, in order to avoid errors due to contact resistance. Please note that the VHF-UHF coil inductance is indicated in nanohenries. The HF portion of the listing is stated in microhenries.

MATERIALS

Pins are tin plated.

Coil base is made of temperature resistant DAP.

Coil form is made of glass woven polyester.

The core structure of the coil consists of cup core and a threaded center core which combine to give good magnetic shield.

Both core elements are made of powdered iron, to minimize performance variation with temperature.

Electrostatic shield consists of a copper can, tin plated.

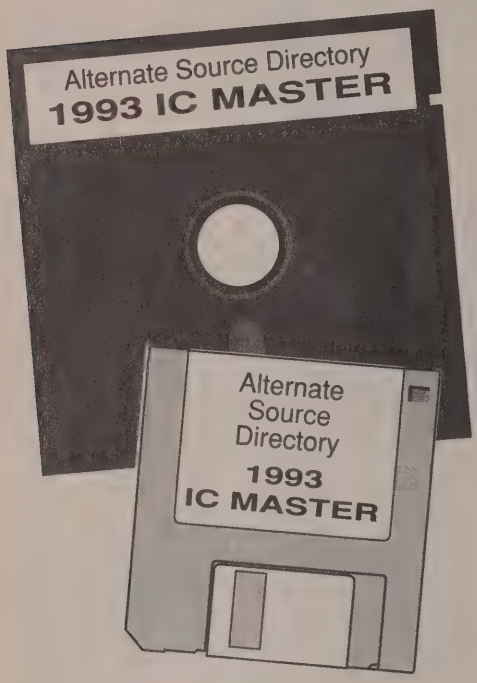
ICMASD

Alternate Source Directory



The all new 1993 ICMASD-IC Alternate Source Directory on Disk is identical to the Alternate Source Directory Section contained in Volume Two of the printed version of the 1993 IC Master. All you need is an IBM XT/AT or 100% compatible personal computer with hard drive.

ICMASD is the most comprehensive and reliable guide available to all ICs known to have a realistic replacement or alternative. The 1993 version contains over 106,000 listings to help you find the functional equivalents for both current and discontinued parts.

The electronic ICMASD is fast, convenient...and can be customized for your specific needs!

ENHANCED FLEXIBILITY

ICMASD is organized in a similar fashion to the printed version in the IC MASTER. The database is arranged by manufacturer, showing the manufacturer's original basic part number. All known replacements for that part are listed in alphanumeric order.

The enhanced flexibility of the electronic ICMASD allows you to add comments, up to 19 digits long, to any device listing in the system. These comments can be part numbers, project notes, prices, or any information unique to your application.

USER FRIENDLY

ICMASD is very user friendly. There are no tricky commands to learn. The software is completely menu driven. ICMASD comes complete with documentation that is brief and to the point. It can be ordered on five 51/4" double-sided, double-density disks OR on one 51/4" high-density disk OR on one 31/2" high-density disk.

Published annually in March

FAST AND CONVENIENT

ICMASD includes a complete Manufacturers & Distributors Directory listing the addresses and phone numbers of every manufacturer in the IC industry. With this complete directory any manufacturer or distributor is just a phone call away.

To order your 1993 ICMASD,
contact your local IC MASTER distributor or, send your purchase order and check for $179.50 plus tax* to:

MagneTek Triad

Inductors, Common Mode and Current Sense

DESCRIPTION: Highly dependable TRIAD common mode EMI suppression inductors manufactured by MagnaTek are used in various types of power supplies to eliminate noise common to all lines. These units also provide effective differential mode filtering. Meeting VDE, IEC, UL, and CSA requirements, they minimize AC line transmitted interference often created by high frequency switching power supplies. Normally placed close to the input power source, these compact inductors are constructed with UL rated 130°C materials.

DESCRIPTION: TRIAD output filter inductors from MagneTek are used in output circuit applications to provide a more constant current source by storing energy. These inductors have exceptional performance characteristics across the entire specification range with their primary storage function being energy storage. As opposed to other output filter inductor designs offering only a single winding, these devices offer design flexibility so that several outputs can be fed through different windings on the same core.

DESCRIPTION: TRIAD toroidal filter inductors from MagneTek are specially designed to minimize transients. These devices store energy, and therefore, condition the output signal by leveling out the current waveform providing a more stable current supply. Generally used in high frequency circuits, our standardized design provides an economical solution for use in differential mode applications or as an output filter inductor.

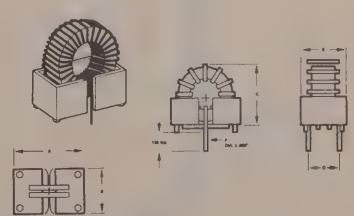

Figure A

TECHNICAL NOTES:
1. Nominal inductance values are typically 10% higher than minimum rating.
2. Biased inductance measured at rated DC amps.
3. Operation at rated current yields @ 40°C rise over 20°C ambient.

MCE
MAGNETIC COMPONENT ENGINEERING CO., INC.

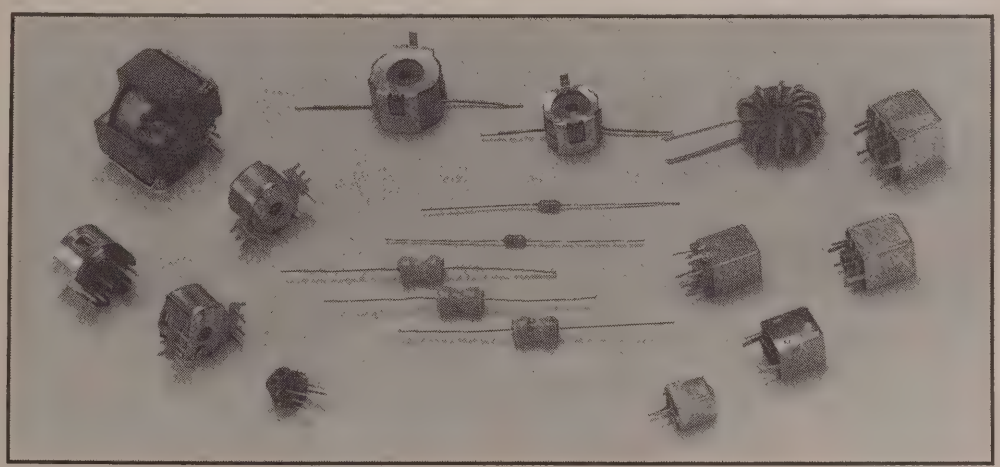
Magnetic Component Engineering has been designing and manufacturing high performance magnetics since 1973. Manufacturing is done with statistical process control at all points in every phase. Our facilities conform to MIL-I-45208A and we have been a continued supplier to the aerospace and defense industry since 1973. When you need quality components on time, MCE will deliver.

INDUCTORS

All types of inductors are designed and manufactured at MCE. These include axial leaded, PC board mountable, tunable, high current, precision inductors, low profile, and small footprint inductors. We carry over a million inductors in our inventory for immediate shipment.

COILS

A large cross-section of coils are available both shielded and unshielded. Tunable coils will be designed around your specifications and requirements. The inductance range available with standard hardware is form 50nH to 480mH. Inductance values outside this range can be custom designed. Our coils offer a wide range of frequencies, high Q, and high quality.



CUSTOM WINDING

Our manufacturing facilities have the capabilities for custom winding pot cores, E-cores, RM type cores, antenna bars, antenna rods, toroidal cores and other RF components. With our fully equipped manufacturing facility, all custom gapping of cores is done in-house giving high reliability and fast deliveries. CNC winding equipment ensures consistency and reliability at low cost.

DESIGN & PROTOTYPING

MCE can custom design any RF magnetic component fast. Prototypes can be quickly manufactured and shipped for approval. All this is possible because we can custom precision grind our cores in-house. If you need to try out your design, use our facilities for a quick turnaround.

MURATA ERIE NORTH AMERICA

chip inductors

Murata Erie's SMT inductors utilize a new coil winding technology, permitting high current capabilities and excellent frequency characteristics in an extremely small chip design. Available in a wide range of inductance values ranging from 4.7nH to 2.2mH. Using Nickel Alloy metalization material for electrodes, these chip inductors can be either flow soldered or reflow soldered. Their square design allows automated processes.

Penn-Tran Corporation

Designers and Manufacturers of CRT Deflection Components

A Spectrum Electronics Corporation

Penn-Tran reaches beyond mere component manufacturing by creating High Voltage Modules (Horizontal Drive Boards) of matched magnetic components. These two examples package the Flyback Transformer, Yoke, Width Coil, Linearity Coil and Drive Transformer. The addition of an appropriate Penn-Tran High Voltage Power Supply completes the system.

Let our component teams and our 46 years of deflection experience save time, money and the difficulty of matching random components from multiple manufacturers. All we need is the parameters of your display's horizontal drive section. Penn-Tran engineering does the rest.

Yoke—CRT Matching

Ship your CRT to us and we will manufacture a deflection yoke, match it to your CRT, deliver a package to you ready to place in your monitor and use without further adjustment.

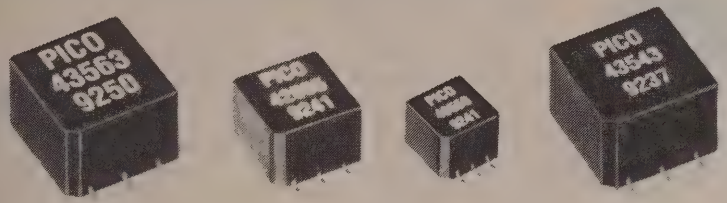
PICO's Miniaturized Power Inductors

PICO Surface Mount Power Inductors are ideal for Noise, Spike and Power Filtering Applications in Power Supplies, DC-DC Converters and Switching Regulators

SURFACE MOUNT
PICO surface mount units utilize materials and methods to withstand extreme temperature (220°C) of vapor phase, I.R., and other reflow procedures without degradation of electrical or mechanical characteristics.



- Minimum possible size
- Manufactured to MIL-T-27 (TF5S04ZZ)
- Special high frequency core material to insure low losses
- All units have split windings
- Large selection of sizes available

All inductors have split windings—ratings shown in table are for series connection. Parallel connection will have ¼ inductance at twice the DC current and ¼ the DC resistance, ie. parallel connection of PICO-41400 will have 5 millihenry at .12 Amps DC with DC resistance of 13.5 Ohms

These Inductors are well suited for use in Switching Regulators, DC to DC Power Supplies and all types of Electrical Equipment where the elimination of line transmitted Electromagnetic Interference is important. Electrical equipment will generate noise due to switching operations of transistors, SCR's, relays, triacs, etc. By using these Inductors, noise being fed back to the power line is minimized to an acceptable level and this noise will not interfere with other equipment operating on the same power line.

Common EMI Mode Suppression Inductors

- **Minimum possible size**
- **130°C operation (Ambient + Temp. Rise)**
- **Windings Balance ± 1%**
- **Dielectric Strength .... 1500 Volts RMS**
- **All units are magnetically shielded**

These Inductors are well suited for use in Switching Regulators, DC to DC Power Supplies and all types of Electrical Equipment where the elimination of line transmitted Electromagnetic Interference is important. Electrical equipment will generate noise due to switching operations of transistors, SCR's, relays, triacs, etc. By using these Inductors, noise being fed back to the power line is minimized to an acceptable level and this noise will not interfere with other equipment operating on the same power line.

ALL INDUCTORS ARE MEASURED AT 0 DC. THE MAXIMUM DC LISTINGS ARE FOR APPROXIMATELY 30°C HEAT RISE AND APPROXIMATELY 2% DROP IN INDUCTANCE. THE CHANGE OF INDUCTANCE WITH AC OR DC CURRENTS IS ILLUSTRATED BY THE CURVES. THE EXCITATION IS PLOTTED IN mA ×√mHy. FOR EXAMPLE THE 0.495 mH INDUCTOR (62272) WITH 170 mA DC FLOWING WILL HAVE AN EXCITATION OF mA ×√mHy = 120, AND THE INDUCTANCE WILL DROP FROM 495 uH to 485 uH. IF THE 170 mA WAS AC, THE INDUCTANCE WOULD BE 510 uH.

PICONICS MICRO INDUCTOR PRODUCTS AND APPLICATIONS

The principal application for Piconics' Inductors has traditionally been in linear hybrid amplifier, micro-strip and stripline circuits. These designs have been used in a wide range of systems from the Space Shuttle Program to commercial microwave applications. Major use is in military systems where excellence and tight quality controls are required.

Piconics' components feature excellent stability, high Q and controlled characteristics. They are packaged in various configurations with a wide range of lead materials. Internal connections are welded to avoid the problems associated with high temperature soldering. Encapsulation is mechanically interlocked to strengthen all surface (shear) bonds. The materials and methods used at Piconics are compatible with normal requirements in hybrid circuit manufacturing.

Piconics' custom design capability has led to the development of unique products. Should your inductor requirements be outside the parameters of our standard listings, contact Piconics directly for a prompt quotation to your needs.

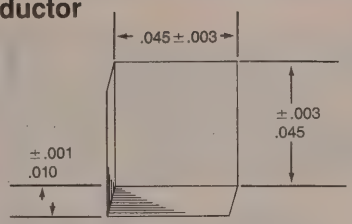
PICONICS MICROWAVE COMPONENTS
SP, M, MG AND MC SERIES

SP Series Spiral Chip Inductor

This style inductor may be used where low inductance values are required and gold wire bonding is the method for making interconnections. When used as an r.f. choke, attach center pad to r.f. and outside pad to power supply. Custom designs available. Other ceramic materials having various dielectric constants are available.



DIMENSIONS IN INCHES

NOTES:
(1) Self-resonant frequency may be increased by mounting inductor on an insulating stand-off. These stand-offs can be provided by Piconics.
(2) Inductors to 25 turns in this geometry are available on special order.
(3) Attachment is generally made using non-conductive epoxy such as EPO-TEK H-61 or EPO-TEK H-20.
(4) Thermosonic wire bonding using1 mil gold wire is recommended for lead attachment to this style inductor. Gold ribbon may also be used.
(5) Resonances shown in the tables are the lower self resonances encountered. Typical values are higher.
(6) Measurements are very dependent on fixturing and frequency.
(7) Quartz typically gives high SRF and Q's than ceramic due to lower Dielectric Constant.
(8) Bonding are typically .005" in diameter.
(9) Other thicknesses, values, sizes available on request.

Piconics' M and MG series are microminiature broadband air core chokes with high self-resonant frequencies, suitable for microwave applications. Piconics' M and MG series chokes provide inductance values from 10nH to 700nH, operating frequencies from 100MHz and self-resonant frequencies from 1GHz to 28GHz.

Piconics' M and MG series chokes are available from 2 to 100 turns for standard models. Special models can also be provided. Applications includes oscillators, mixers, switches, stripline devices, broadband modulators, power supplies, filters and frequency multipliers.

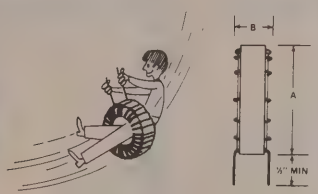
Swingductor™ RL1386 /RL1518

185 values each version

(unmounted) (mounted, shown)



Designed for applications requiring a known inductance change with changing current loads (as in power supplies). Although similar in appearance to conventional toroids, the special core material allows a "controlled saturation," so that a specific inductance value is repeatable at a specific current. The core material is effective up to 1 MHz. As a result of toroidal design, the Swingductor™ produces a closed magnetic field, resulting in low EMI. All are supplied with pretinned leads for easy PC board installation.

Current transformers are used to sense a current in a conductor and provide a voltage which is proportional to that current, while providing high voltage isolation. These current transformers are suitable for switch mode power supply applications and are rated for 130°C operating temperature and 2500V dielectric withstanding voltage. Center tap models are also available.

Common Mode Inductors are most often used to eliminate line transmitted noise, such as that caused by transistors, SCR's, etc., in switch mode regulated power supplies. Interference caused by multiple equipment on a common power line can be minimized by the "split-winding" design, thus reducing the inherent conducted noise to an acceptable level. See toroid common mode filtering circuit on facing page. Special note should be made of the phasing dots.

COMMON MODE INDUCTORS

TOROTEL PRODUCTS INCORPORATED 13402 SOUTH 71 HIGHWAY GRANDVIEW, MO 64030 (816) 761-6314 FAX (816) 763-2278

- **Ideally suited as switching regulator and coupled inductors, common mode chokes, or in other power filtering applications.**
- **The temperature rise is less than 30°C when measured at an ambient temperature of 100°C, 0.1 v rms, 10 khz, and at rated DC current as shown in the Tables below.**
- **A large selection of sizes provides maximum performance for minimum size.**
- **Each unit is magnetically shielded.**
- **Units QPL'D to MIL-T-27/356 are also available.**

All inductors have split windings for versatility. They can be connected in series, parallel or individually for balanced filtering applications.

The ratings in the tables below are for a series-aided connection of both windings. The inductance of a parallel connection of these windings will result in 25% of the inductance at twice the rated current. The DCR will be 25% of the series connection.

INDUCTORS

Switching Regulator Inductors
AIE Magnetics manufactures a line of inductors for DC-DC converters, lower current outputs or switching power supplies. These inductors have been designed to operate with switching regulators, available from several semiconductor manufacturers, which operate in the 30-500 Khz range.

TYPICAL APPLICATIONS
- *BOOST CONVERTERS*
- *BUCK CONVERTERS*
- *BUCK-BOOST CONVERTERS*

FEATURES
- *REQUIRE MINIMAL CIRCUIT BOARD SPACE*
- *SHIELDED FROM RADIATING NOISE*
- *SEALED TO WITHSTAND ALL BOARD CLEANING PROCESSES*

Fixed Inductors...Micro-Miniature and Miniature
AIE Magnetics fixed inductors offer the optimum in design efficiency and provide the highest inductances per unit of volume. These inductors provide your design solution in two distinct areas: (1) Small DC currents with non-critical temperature coefficient of inductance and (2) where DC current is a design factor and where a low temperature coefficient of inductance is desired.

TYPICAL APPLICATIONS
- *DECOUPLING NETWORKS*
- *FILTER CHOKES*
- *PEAKING AND COMPENSATING CIRCUITS*
- *TONE COLOR FILTERS*
- *OSCILLATORS*
- *TONE DECODING*

FEATURES
- *MICRO-MINIATURE & MINIATURE SIZES*
- *LOW TEMPERATURE COEFFICIENT OF INDUCTANCE*
- *ENCAPSULATED*
- *MIL-C-15303 FEATURES*
- *SOLDERABLE LEADS*
- *WELDABLE LEADS (Optional)*

Variable Inductors...Miniature
AIE Magnetics variable inductors are typical of our miniaturization efforts for high Q's and high inductances in a minimum of space. These printed circuit mount, shielded inductors offer top tuning for easy access. If your packaging demands dictate side tuning, we can modify our Series 38 for this purpose.

TYPICAL APPLICATIONS
- *HIGH Q TUNED CIRCUITS*
- *FILTER NETWORKS*
- *TANK CIRCUITS*
- *BLOCKING*
- *DECOUPLING*
- *PULSE WIDTH CONTROL*
- *CONTROL OF RL OR LC CONSTANT*

FEATURES
- *MINIATURE SIZE*
- *TEMPERATURE STABILITY*
- *20 KHZ TO 100 MHZ*
- *PRINTED CIRCUIT MOUNTING*
- *± 20% MINIMUM TUNING RANGE*
- *L'S FROM .10 MICROHENRIES TO 22 MILLIHENRIES*

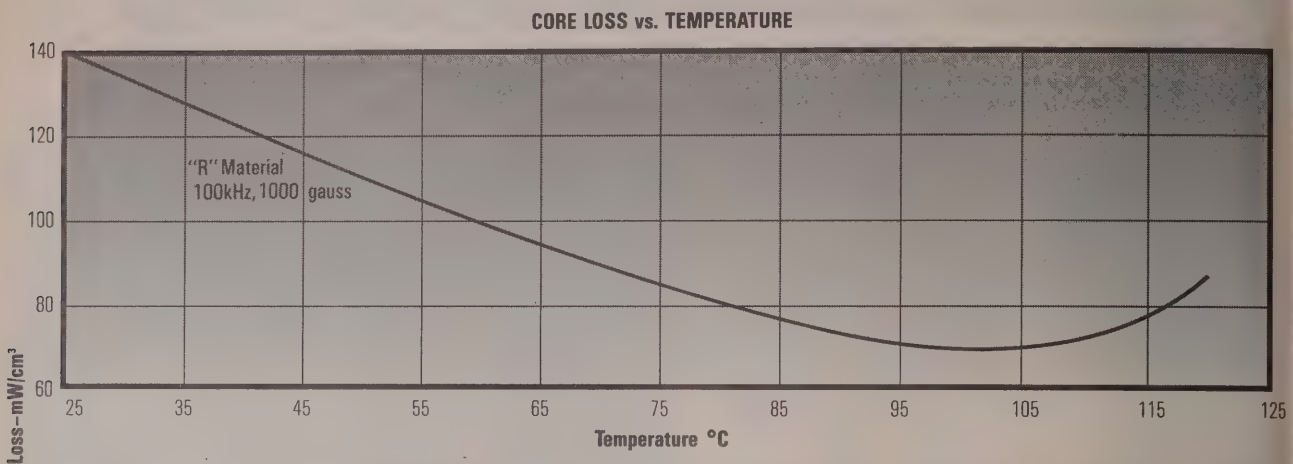
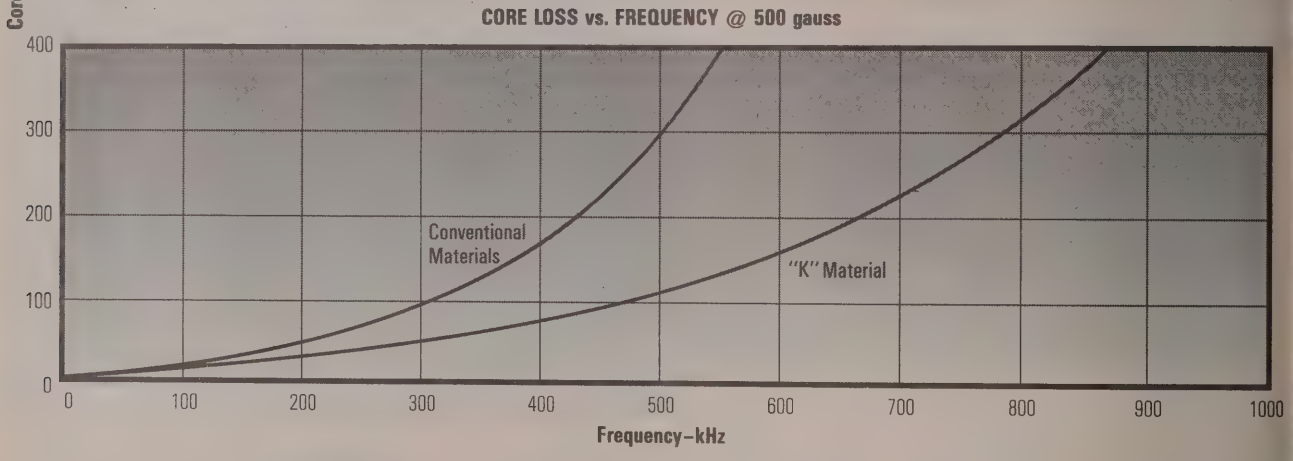
Need ferrites for high frequency power supplies?





MAGNETICS delivers two new materials.

Cooler switching improves efficiency or cuts sizes.

Heat's the problem, but our cores don't build it up. Designed for use at 25 to 200kHz, core losses of our new **"R" material** actually decrease up to 100°C.

Want to cut size? If your power supply operates over 200kHz, our new **"K" material** core losses are reduced by half or more over conventional materials.

What's more, flux density and permeability for both materials stay higher at elevated temperatures when compared to other ferrite materials.

Magnetics offers the designer the broadest assortment of sizes and geometries, specifically developed for switched mode power supplies.

We offer a wide variety of sizes and geometries that include ECs, ETDs, lamination size Es, slab-sided solid center post types, pot cores, toroids, RMs, PQ and low profile shapes.

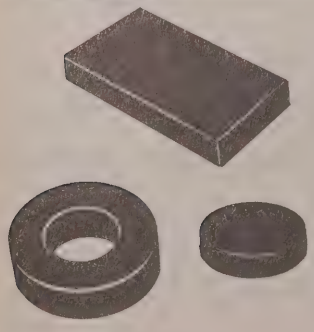
CERAMIC MAGNETS



available in most sizes

Ceramic magnets are Barium Ferrite permanent magnets. They are extremely resistant to demagnetization (they lose approximately 4% of their strength every 100 years!) and are relatively inexpensive. They are extremely resistant to solvents and corrosive agents.

There are several grades of ceramic magnets:

Grade 1 Ceramic are unoriented and inexpensive. These magnets are usually magnetized conventionally but can be ordered multipole.

Grade 5 Ceramic are oriented. They are usually magnetized conventionally. The energy product is very close to that of Alnico 5, a fine magnetic alloy.

Grade 8 Ceramic is also oriented. It is even more resistant to demagnetization than Grade 5 Ceramic.

FOR HIGH TECH APPLICATIONS

MAGNETICS®
Division of Spang & Company

THE BROADEST RANGE OF MAGNETIC CORES FROM A SINGLE SOURCE

Ferrites
Ferrites are ceramic structures made from high purity oxides of manganese, zinc, and iron. They are pressed, fired, and machined to meet requirements. They can be used over a wide frequency range, having a high electrical resistivity and low eddy current losses, for low level and power applications.

Powder Cores
Molypermalloy powder (MPP) cores are a distributive air gap type and have many outstanding characteristics-high resistivity, low hysteresis and eddy current losses and excellent inductance stability under both dc and ac conditions. MPP, High Flux, and Kool Mμ® cores are excellent for uni-directional drive applications such as pulse or fly back transformers.

Tape Wound Cores
Tape wound cores are made from high permeability magnetic strip alloys (.0005" to .014" thick) of nickel-iron (80% or 50% Ni), silicon-iron, cobalt-iron, and amorphous metals.

Bobbin Cores
Bobbin cores are miniature tape cores made from ultra-thin (.000125" to .001" thick) nickel-iron strip (80% Ni or 50% Ni) wound on non-magnetic stainless steel bobbins. Covered with protective caps and epoxy coated, bobbin cores are made as small as .050" in ID and widths of .032".

Cut Cores (nickel-iron, cobalt-iron, amorphous)
These cores are ideal for applications where low core loss is needed and core saturation is undesirable.

*Frequency depends on adjusting operating flux density to levels that keep core losses to acceptable limits.
(1) Core losses decrease up to 100°C
(2) Core losses decrease up to 70°C, remain low to 100°C
(3) Low core losses at lower temperatures

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with the System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

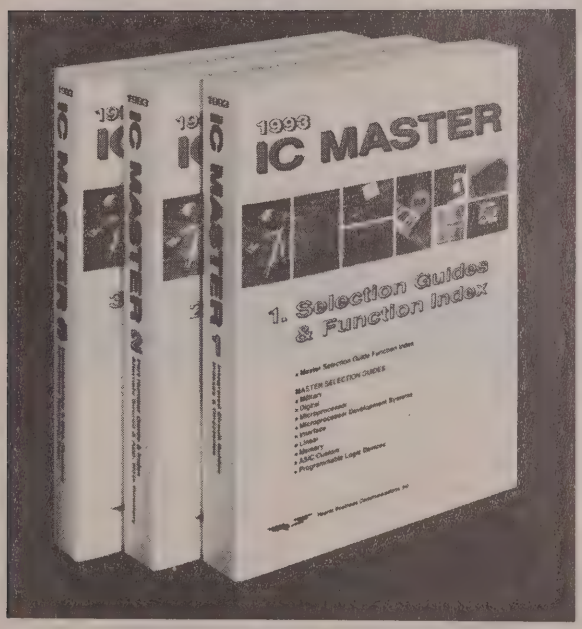
SUPER TIME SAVER!



Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your job has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516)227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, FAX Marie at (516)-227-1901. She'll FAX the IC Master subscription form back to you right away.

And, if you tell her you saw it in the 1993/94 EEM, she'll take $10 off the subscription price!

EFRATOM is the recognized world leader in rubidium atomic precision time and frequency systems for military/aerospace and commercial applications. Utilizing state-of-the-art atomic oscillator technology, EFRATOM has conceived and developed a family of time and frequency references for radio navigation, geophysical survey positioning systems, satellite tracking and control, communication systems employing PCM and spread spectrum techniques and standard time and interval generation and transfer.

EFRATOM's Model M-3000 is a miniature military atomic oscillator measuring just 3.25 in × 3.25 in × 4.5 in (83 mm × 83 mm × 114 mm), yet this instrument has excellent long term stability and fast warm-up performance. Model M-100 and M-3000 rubidium oscillators are radiation hardened and offer unparalled performance in the toughest of airborne and ground environments.

EFRATOM also offers modular frequency components, Model MFS in a 19 inch rack, permitting the user to configure unique time and frequency systems for his application. The MFS is also available with GPS disciplining of a Rb oscillator as an alternate to the cesium standard and to provide UTC time.

EFRATOM has also entered into quartz technology with a line of very high end crystal oscillators achieving state of the art specifications in terms of low power, small size, and fast warm-up all at super OCXO performance.

Model PRFS (Portable Rubidium Frequency Std) employs a rugged, compact design consisitng of the Model FRS-C rubidium oscillator, buffer amplifier and regulated power supply. The PRFS is available as a portable instrument for laboratory or field use.

Doubly Rotated Cut Crystals

The SC cut leads the family of doubly rotated cut crystals in warmup, phase noise, G sensitivity, and aging characteristics when compared to the AT cut. FC and IT cut crystal performance approaches that of the SC cut. As the graphs indicate, frequency temperature behavior differs which can be advantageous in certain applications.

Typical Characteristics for Third Overtone Crystal Cuts

Doubly rotated cut crystals are offered in fundamental, 3rd and 5th overtones over a wide frequency spectrum. Many holder configurations are available.

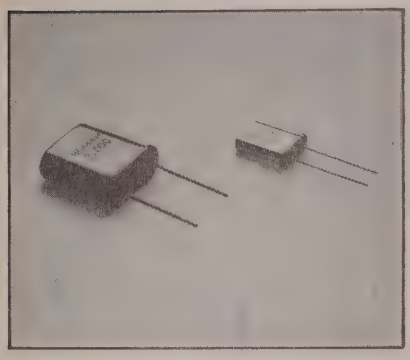
FAST DELIVERY OF QUARTZ CRYSTALS

MADE IN THE U.S.A.

We specialize in the production of non-standard frequencies for microprocessor and frequency controlled applications.



Bomar can provide AT Cut Crystals from 1 MHz to 100 MHz. The AT Cut operates on the fundamental and all odd overtones. This cut maintains the lowest of all temperature coefficients, supplies an extremely high Q, plus it offers an economical cost which makes it the standard for most oscillators such as temperature controlled as well as non-controlled types, and in filter applications. The frequency may be multiplied up or down as needed.

Product applications are in mobile, portable and base station communications, radio transceiver filters, computer modems, satellite frequency converters, and in any field where truly clean, drift-free reception is required.

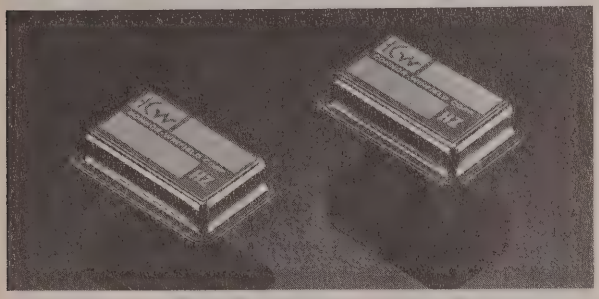
NEW PRODUCTS FOR 1993/94



Clock Driver Oscillator and Module For Pentium

Connor-Winfield Corporation now has available a clock oscillator specifically designed to drive minimum skew clock drivers for clock generation applications operating at high frequencies. This new oscillator was originally designed to provide the clock input to drive the Pentium microprocessor. Connor-Winfield's model UPA53 is available with frequencies from 25 MHz to 100 MHz and can be used to provide the input for clock drivers available from Motorola, National, and many others that are designed specifically for operation with the Pentium microprocessor.

In addition, Connor-Winfield is also offering a complete module packaged in an all metal, hermetically sealed 14-pin DIP. This module combines the clock driver and the oscillator into one package providing up to 9 outputs. The module provides a symmetrical output current drive of up to 24 mA and a maximum output skew of 600 ps and is also available for extended temperature range applications.

Please call for additional details!

Digitally Compensated Crystal Oscillators

Connor-Winfield announces a new line of digitally compensated crystal oscillators. Housed in a 24-pin hermetically sealed DIP, this new oscillator design can provide extremely tight frequency versus temperature in a variety of logic types and frequency ranges.

Whether you need a frequency standard of 10 MHz or a telecomm frequency of 155.52 MHz, Connor-Winfield can provide you with stabilities as tight as .2 ppm over extended temperature ranges. In addition, ECL outputs or CMOS outputs are available as standards. Voltage control capability can also be provided in CMOS or ECL logic. Because of the modular design approach, virtually any oscillator circuit we make can be incorporated into this package providing superior stability characteristics.

If you have an application, please give us a call!

New TCXO Models Available

Due to customer demand, Connor-Winfield has designed several TCXO's for second sourcing of our competitor's products. A recent addition is a 14-pin double DIP with external frequency adjustment. Stabilities are available to +/- 1 ppm. Call for details!

PRECISION QUARTZ CRYSTAL RESONATORS

Description: CTS High Stability Precision Resonators are used where specific tight parameter control is required. These crystals are used in communication, instrumentation, and military applications where specialized performance, documentation, or testing demands extra attention. These crystals are either calibrated at room temperature, or at elevated temperature for ovenized oscillator applications.

MINIGLOSSARY CAPACITORS

Anode: One of two plates or conductors. In polarized capacitors, the anode should be connected to the positive conductor in the circuit.

Capacitive Reactance: The opposition (in ohms) of capacitance to the flow of alternating current, equal to the reciprocal of the product of the angular frequency (2π times frequency in Hertz) of the current times the capacitance in farads.

Cathode: One of two plates or conductors. In electrostatic capacitors the cathode is metallic. In electrolytic capacitors the cathode is a liquid, gel or other conductive material which is in intimate contact with a metallic cathodic connection.

Dielectric Constant: The ratio of the capacitance of a capacitor with some material other than air between the capacitor plates to the capacitance of the same capacitor with air between the plates. For example, the dielectric constants of air, Teflon®, polystyrene and ruby mica are 1, 2.1, 2.6 and 5.4, respectively.

Electrolytic: A capacitor with one metallic conductor (generally the anode) and with a liquid or semiconductor cathode. Nonpolarized electrolytic capacitors generally have two equal anodes as well as the liquid cathode. These anodes operate alternately as anode and cathodic connection as alternating current is applied.

Electrostatic: One of two general classes of capacitors in which two or more discrete metallic conductors are present and separated by an insulating dielectric material. Examples include: mica, ceramic, film, and paper types.

Farad: The basic unit of measure in capacitors. A capacitor charged to one volt with a charge of one coulomb (one ampere flowing for one second) has a capacitance of one farad. Capacitors are generally rated at portions of a farad (microfarads or picofarads).

1 farad (F) = 1,000,000 microfarads (μF) 1 microfarad (μF) = 1,000,000 picofarads (pF)

Impedance: All capacitors exhibit impedance. It is a function of capacitor type and internal construction. This can be particularly important in certain applications such as filters for switching power supplies. Capacitors used in these applications often have special multiple tab construction to shorten current paths and to reduce internal resistance.

Leakage Current: Expressed as dcl for electrolytic capacitors, a measure of the intrinsic losses in a charged capacitor. Generally speaking, the lower the dcl, the higher quality the capacitor.

Power Factor: A measure of the overall efficiency of a capacitor. Power factor ratings take all internal losses into consideration in a complex formula. This parameter of certain capacitors is often very important in AC applications such as motor-start and/or motor-run capacitors

Rated Voltage: The rated working voltage of a capacitor. Generally expressed in DC Volts (Vdcw). This is the voltage at which a capacitor may be safely operated at 25°C continuously within its overall parameters.

Ripple Current: The total amount of alternating and direct current that may be applied to an electrolytic capacitor under stated conditions. In general, the higher the ripple current applied, the shorter the operating life of the capacitor will be. Application of significantly higher than rated ripple currents can shorten the capacitor life dramatically and may even cause catastrophic failure (explosion).

Surge Voltage: The momentary surge voltage which may be applied for a stated length of time without doing permanent damage to the unit.

Temperature: Capacitors are generally rated at 25°C at sea level under specific humidity conditions. Operating temperature ranges are also given, along with derating (reliability) curves for operation at temperatures other than 25°C.

Temperature Coefficient: Expressed as TC in ppm (parts per million) or in percent (%) from the norm of 25°C. This is seldom a straight line and may vary widely for certain types. Most capacitors have positive TC in that the capacitance increases as temperature increases. Some types, however, have negative TC in that the capacitance decreases as temperature increases.

HCMOS/TTL CRYSTAL OSCILLATORS

ECLIPTEKS' EC1100SJ Series and EC1100SC Series of HCMOS/TTL clocks provide you with the highest quality crystal timing source available while giving you the flexibility of stocking one part to meet both your HCMOS and TTL compatibility needs. Available options include tri-state, tight symmetry, extended temperature range.

The EC1100SJ Series of HCMOS/TTL Compatible oscillators from Ecliptek provides you with the highest quality crystal timing source available. Utilizing state-of-the-art transfer molding technology, these oscillators employ an 'AT' cut crystal in a hermetically sealed metal can, which is then encapsulated in the plastic package. A built-in bypass capacitor is designed into the circuitry, minimizing EMI. Manufactured with an optimized leadframe, four 'J' leads provide exceptional stress relief when mounted on printed circuit boards, and are consistent with common industry solder pad geometries. Options include tri-state, extended temperature ranges, and tape-and-reel.

Fox Programmable Oscillators offer convenience with space & power savings for applications such as Computers and Peripherals, Graphic Board Dot Clocks, R.F. Designs, and Variable Frequency Environments

Fox Electronics is now offering two models of synthesizers with built in quartz crystals. The F6151 has two programmable outputs from .320 - 115 MHz. Three other outputs are available from the CLKA/2, CLKA/4 and FREF pins. The F6053A has a single output with a frequency range of .360 - 120 MHz.

Some RF applications for the devices include:

1. Adjustable reference frequency for prototyping & testing.
2. Low cost sweep generator for scanners & etc.
3. Frequency hopping - agile carrier for secure communication applications.
4. Power conservation for portable systems on standby.
5. Systems that require multiple frequency standards for international sales.

Other applications using the programmable oscillators are:

1. Hard disk drives - to vary frequency according to the radius of the drive to allow storage of up to one-third more data.
2. Laptop computer - to slow the oscillator speed to produce less power consumption, or speed it up to produce higher performance.
3. Graphic board dot clocks - to allow dynamic synchronization of different monitors or display resolutions.
4. On-board test strategies - to skew a system's desired frequency (eg ±10%) in worst case evaluations.

The hybrid's output is based on a phase-locked loop oscillator input derived from an internal 14.31818 MHz reference clock. The output is programmed via two wire serial inputs, and can be set to the reference frequency during frequency change so that the output signal will transfer, glitch-free, from the old frequency to the new one. Setting time between frequency transitions is less than 10ms

The F6053A/F6151 oscillator's programmable 3-state output operation supports "wired-OR" connections between external clock lines. Output frequencies are limited by the particular target output, but are generally within 0.1% of the desired frequency. With a well-regulated input voltage, the voltage-controlled oscillator (VCO) quickly locks onto the reference frequency, and produces an output oscillation almost as stable as the input reference with respect to time and temperature.

Short term stability (a.k.a. jitter) is measured by how the VCO keeps pace or slows down to maintain lock with the reference frequency. Testing on a range of mother boards and graphics cards has shown the jitter rate to be acceptable for normal operation, even in those boards and cards designed for single frequency operation. Jitter is less that 500 ps.

Reasonably priced evaluation kits are available now. Typical test hardware needed includes a 5VDC source, an IBM compatible PC with 3.5" floppy drive & VGA monitor, and an oscilloscope. Our kits include a test board, oscillator, software & data sheets containing all the timing diagrams and programming examples needed for firmware engineering. Call now to order your kit. **Kit with 1 oscillator $25.00**
Kit with 2 oscillators $35.00

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with the System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

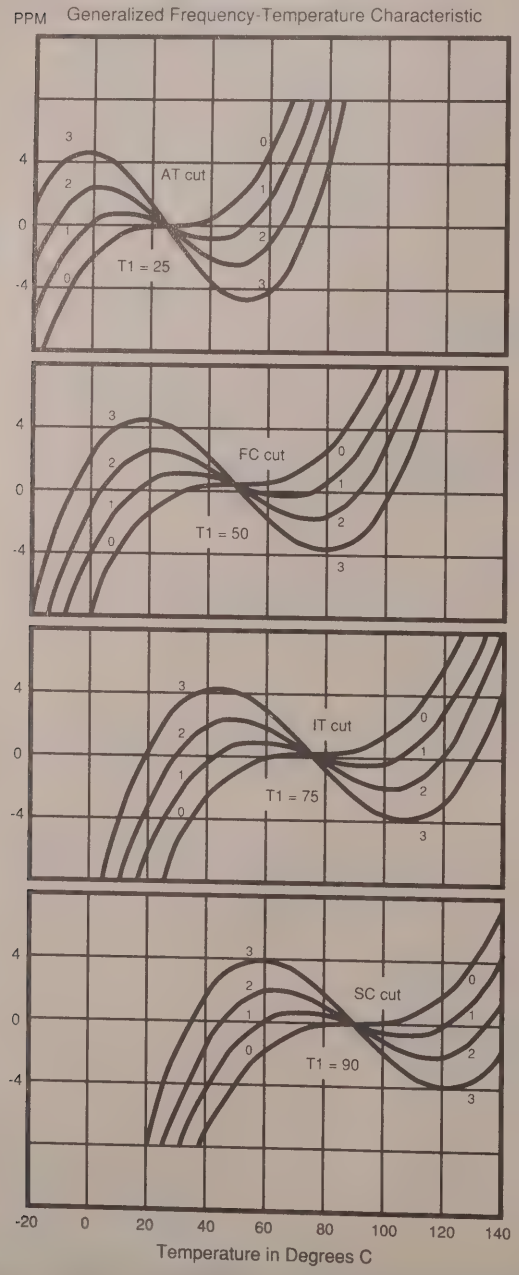
OAK FREQUENCY CONTROL GROUP

Oak Frequency Control Group (OFCG) manufactures quartz resonators from 800 KHz to 360 MHz, fundamental to 11th overtones, in a complete range of holder styles.

With two manufacturing facilities, OFCG Crystal, leads the industry in the design and manufacture of low phase noise and microphonics, low aging rate and high frequency fundamental crystals.

DOUBLY ROTATED AT (DRAT) CRYSTAL CUTS



Oak Frequency Control Group has established a design and manufacture capability for a range of doubly rotated resonators such as FC, IT, and SC resonators.

Frequency-temperature curves of DRAT resonators are very similar to those of AT-cut. The most significant difference is that where AT has an inflection temperature (T) in the area of 25°C to 30°C depending on design and frequency, the inflection temperature will be in the area of 45°C to 55°C for FC, 70°C to 80°C for IT, and 85°C to 95°C for SC. Curves of DRAT resonators are flatter than corresponding AT cuts.

The temperature stability advantage is valid only for higher temperatures where DRAT resonators can show up to 10 times improvement in stability compared to AT resonators. For wide temperature ranges which include temperatures below O°C, better stability can be attained with AT-cut resonators.

The main advantages of these resonators, in particular the SC (Stress Compensated) type are:

- Improved frequency-temperature stability for ovenized applications with operating temperatures in the 60°C to 80°C temperature range.
- Reduced amplitude frequency effect which allows higher drive levels and improved signal to noise ratio.
- Superior thermal transient characteristics resulting in improved short term stability and faster warm up times in oven operation.
- Improved ageing characteristics
- Improved vibration sensitivity
- Higher Co/C1 ratio resulting in reduced sensitivity to circuit component changes.

-Higher Q Factor - 10-15% higher than AT-cut.

DRAT resonators are the right choice for oven controlled crystal oscillators (OXCO). Development of DRAT resonators has significantly improved achievable OXCO characteristics. Presence of the very strong B mode (8-10% above the main mode frequency) somewhat complicates oscillator design. More complex processes, lower yields and lower motional capacitance causing tighter tolerance requirements contribute to higher costs of DRAT cuts.

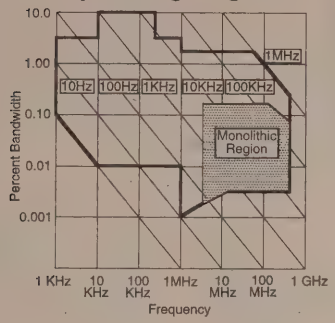
CRYSTAL FILTERS

Operating Regions



Best Operating Regions

This chart gives the regions where crystal filters can be built. The "Discrete Filter" region shows where filters can be built using individual crystals, capacitors, coils, transformers, and resistors. The "Monolithic" region defines where filters, that employ two or more resonators per individual crystal unit (plus some other discrete components), can be manufactured.

The difficulty increases as the edge of the chart is approached and some filter types cannot be realized at or near the edge of the chart. Filters which fall in the two colored regions will be the most producible and all approximation types can be realized within these regions.

Bandpass

Bandpass filters will pass a band of frequencies and attenuate other bands of frequencies both above and below the passband. Single sideband filters are bandpass designs but they form such an important sub-set that they are often given their own classification.

Band Reject

Band reject filters attenuate a specified band of frequencies while passing a broad range of frequencies adjacent to the rejected band.

Discriminators are similar to filters except they produce an output DC voltage which is proportional to the input frequency.

Approximation Types

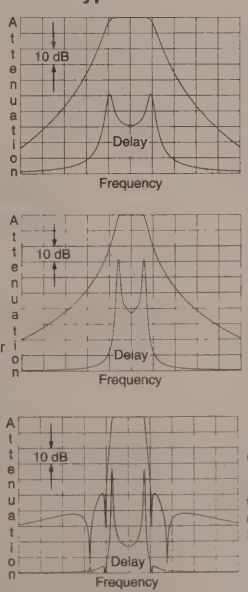
Depending upon the required specifications, an approximation type will be chosen to meet those requirements. The following are the most common types used.

Types used for control of attenuation only

Butterworth–Produces a very smooth, flat passband with a fair rate of roll-off. This approximation produces easily realized networks.

Chebyshev–The response is similar to the Butterworth but with ripple within the passband and an improved roll-off rate. Networks obtained by this approximation are the most easily realized.

Cauer or Elliptic Function–The pass-band ripple is similar to the Chebyshev but with greatly improved stopband selectivity due to the addition of finite attenuation peaks. The network complexity is increased over the Butterworth or Chebyshev but it still yields practical realizations over nearly the entire operating region. All of the responses shown here are for six pole networks with identical design band widths.



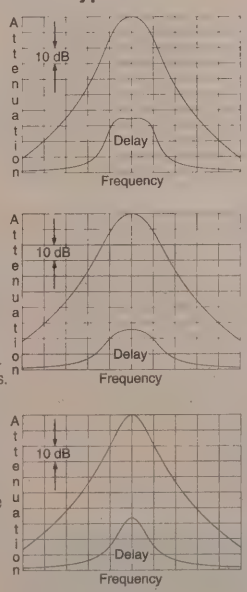
Approximation Types

Types used for phase and delay control

Bessel or Linear Phase–This approximation is the Butterworth of delay control. It produces filters with a flat delay around center frequency. The more poles used, the wider the flat region extends. The roll-off rate is poor. There are some realization restrictions and so these designs cannot be obtained over the entire operating region.

Gaussian–Very similar to the Bessel except that the delay has a slight "bump" at center frequency and the rate of roll-off is slower. Because of the delay response, the ringing characteristics are better than the Bessel. Realization restrictions also apply to these filters.

Synchronously Tuned–These filters have the same advantages and disadvantages as the Bessel and Gaussian except that the ringing response is the best of all design types and the roll-off is even slower than the Gaussian. As with the other two types, some realization restrictions apply. Responses shown are for 6 pole networks with identical 3 dB design bandwidths.



Approximation Types

Compromise types

Chebyshev Phase Error–In this approximation the Chebyshev approximating technique is applied to the phase (delay) over the passband region. It produces the bell shaped amplitude response similar to a Gaussian or Bessel design and an equiripple phase and delay response. The selectivity is better than the Bessel or Gaussian.

Gaussian to 6 (or 12) dB– These filters have passband response that follows the Gaussian shape and, at either the 6 or 12 dB point, the response changes and follows the Butterworth characteristic. The phase, or delay, response is somewhat improved over a strict Butterworth and the attenuation is better than the pure Gaussian and so it is a true compromise type of approximation. As with all of the filters where there is an attempt to control the phase response, the realization becomes more difficult and so its operating region is slightly restricted.

Custom Ringing Response–Sometimes it is necessary to obtain both good ringing response and good attenuation at the same time. In these instances a custom ringing response filter can be synthesized. Because both phase and attenuation must be controlled, these filters require more components and are somewhat larger and more costly than other types.

CMOS, HCMOS, ACMOS & "Z" DRIVERS

Q-Tech "C" type clock oscillators are compatible with the **high voltage, 4000 series CMOS** logic family. Frequencies from .01 Hz to 15 MHz and voltages from 5 volts to 15 volts are available.
Q-Tech's **"HC/AC"** clock oscillators match the **High Speed CMOS** logic family. These HC/AC clocks produce rail-to-rail CMOS logic levels at frequencies to over 100 MHz. These units can drive one TTL load or high capacitance CMOS and NMOS loads.
Options available in the HC/AC line include provisions for **special symmetry** option, a **low current** option for battery operation when the output frequency is below to 100 KHz, and optional 10 TTL drive capability. Although normally run at 5.0 volts like TTL, HC clocks can operate down to 2.5 volts, with some restrictions on maximum frequency.
Extra outputs, gates, special digital functions and automatic testing provisions can often be included at low cost.

ECL

The ECL logic family is characterized by **very high speed** (clocks available to 200 MHz.) Q-Tech ECL clocks are available in 10K, 10KH, 100K, 300K and ECLinPS for compatibility with most ECL systems.
ECL components typically use a negative Vcc of − 5.2 Volts D.C., referenced to ground pin. For example, the Q-Tech QT48 package, built as an ECL clock, would use − 5.2 Volts on pin 7 ("Vcc") and ground on pin 14. Other pin configurations are also available.
ECL oscillators (QT6E1 and QT41E1 series) are available with quick delivery on standard frequencies. For more information, request our brochure.

Other Q-Tech Products

VXCO'S

Q-Tech ***Voltage Controlled Crystal Oscillators*** can be ***"frequency shifted"*** or ***"controlled"*** with an external voltage source. Q-Tech VCXO's, often used for frequency synthesis, clock recovery and other phase lock loop applications, are available in DIP packages (full size and half size / see package outlines) as well as custom packages. Minimum deviation (pulling) is ±100 ppm for a control voltage range of 0 to 5 volts. VCXO's requiring a wider pull range, improved linearity, ECL or sinewave output are also available. Integrating the VCXO, the loop filter and the phase detector into one small package can reduce cost, space and system noise. A variety of complete phase locked loops in a single package are now available utilizing either VCO or VGXO. For more details, please request our brochure.

ECL CLOCK OSCILLATORS

In addition to its complete line of ECL Clock Oscillators, Q-Tech now offers another version of unscreened and fast delivery ECL in 2 standard DIPS: ***QT6E1*** (14 pin DIP) and the ***QT41E1*** (4 pin DIP) ***series.*** These units operate at –5.2 Volts with a frequency range of 1 MHz to 200 MHz. For more details please request our brochure.

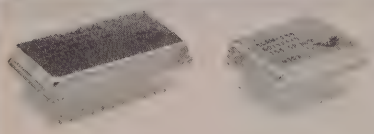
Sonet Clock Recovery Module SCRM-155



- **Clock Recovery and Data Retiming *(with VCXO)***
- ***Meets CCITT Type A or B*-Interfaces with either type**
- **Holdover Feature offers ±20 ppm clock accuracy with no data input**
- **Acquires Lock Quickly (40 bit periods)**
- **Eliminates Pattern (systematic) Jitter**

OPTIONS
- Expanded temperature range of -40°C to +85°C
- Built-in optical receiver

The Vectron SCRM-155 Sonet Clock Recovery Module recovers clock and data from an incoming NRZ PCM data stream. It regenerates the original incoming data stream through the use of an optimally timed decision circuit. The internal VCXO in the SCRM-155 allows the user, without the need of an additional crystal oscillator, to set the clock frequency with an external control voltage (holdover). Compatible with both CCITT Type A and Type B interfaces.

WENZEL ASSOCIATES, INC.
Crystal Oscillators & Standards

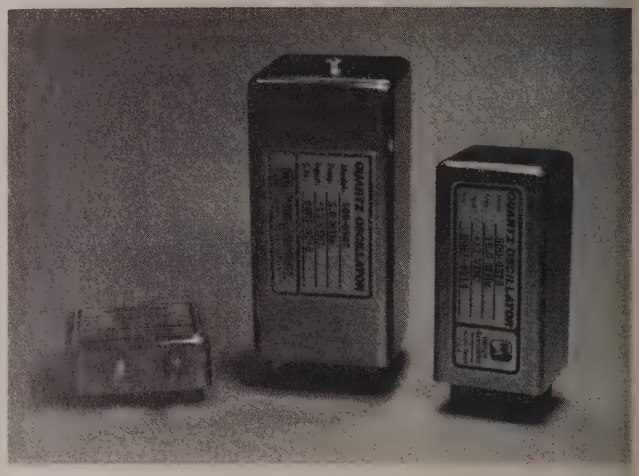
Capabilities

Wenzel Associates manufactures high performance crystal oscillators from 1 to 500 MHz for test equipment, military radar, navigation and communication systems, and the telecommunications industry.

Unprecedented noise performance is available in OEM oscillators as well as in rack mounted phase noise reference standards.

Fast deliveries are available on standard and custom requirements and special low cost oscillators are available where minimal packaging is acceptable for high volume and VSAT applications.

High reliability screening may be requested on several oscillator configurations per MIL-O-55310 built under our quality system based on MIL-I-45208.



Standards

Rack mounted frequency standards may be specified with aging rates of $1x10^{-10}$ per day and outputs at 1, 5, 10 and 100 MHz. Please ask about special frequencies. Multiple output configurations are very often requested and are generally limited only by connector space. Our new ultra-low noise frequency standard provides noise floors better than -176 dBc for both 5 and 100 MHz outputs and provides an excellent reference for critical phase noise measurements.

The QPL Source for Hybrid Oscillators M55310/8, 11, 14, 15, 16, 17, 18, 19

XSIS has earned the reputation among OEM's as the Industry's most reliable supplier of advanced-design microcircuit crystal oscillators. Superior designs and consistent high-quality workmanship make the XSIS oscillators virtually failure-free. Overall quality and the industry's best on-time quoted delivery make XSIS the supplier of choice for hi-rel hybrid oscillators.

All oscillators manufactured by XSIS are tested for all electrical parameters over the operating temperature range. 100% screening tests include fine and gross leak, constant acceleration, automatic temperature cycling and electrical tests plus 160-hour power-on burn in. When required, other testing may include PIND test, destructive and non-destructive bond pull test and die shear test. These tests are also performed in-house on a continuous sampling basis to insure consistent quality.

Environmental tests performed in-house include shock and vibration, salt spray, moisture resistance and 8-hour steam aging. Temperature, humidity, airborne particulate levels and electrostatic discharge (ESD) conditions are monitored and controlled in our expanded engineering, production assembly and test areas.

XSIS Electronics, Inc. is an OEM certified supplier and our only product is the superior hybrid crystal oscillator. As a QPL source, all XSIS microcircuit oscillators are manufactured to the electrical and mechanical parameters of MIL-O-55310, workmanship standards are in accordance with MIL-H-38534, the product assurance program plan is in accordance with MIL-STD-790E, and the quality system is as required by MIL-I-45208B.

XSIS **is** excellence in hybrid oscillators.

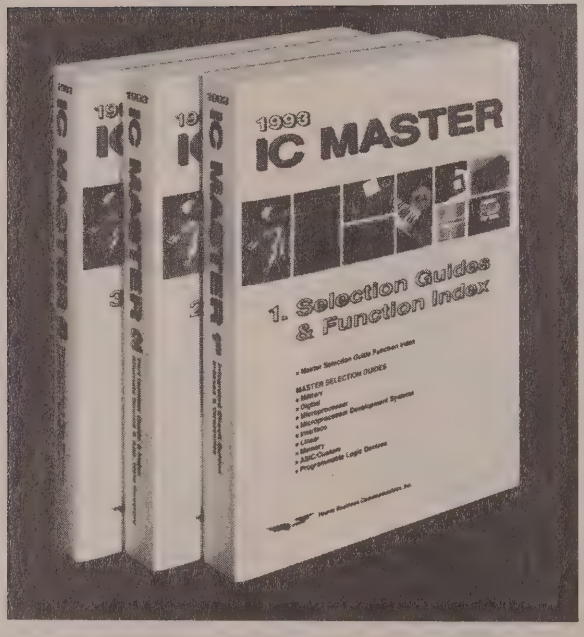
SSSAVER!



Do you work with ICs? Do you have trouble finding the IC you need? Are you sick and tired of sifting through dozens of manufacturers' data books? Do you have trouble comparing one set of specs to another? Are you sick and tired of wasting time?

Do we have good news for you! Get your hands on the latest annual copy of the IC Master. The Master will save you both time and money. Here's how.

The Master lists every single IC you can buy. Better yet, the Master lists ICs by function. You know what you want to do. The Master tells you who makes what for what you want to do.

There's more! The Master lists every known alternate source to every integrated circuit. If somebody makes a substitute for an IC, the Master tells you. And fast!

Want to find a custom or semicustom IC? The Master tells you who the manufacturers are, what their capabilities are, and what design tools you need.

Looking for a distributor or a local sales office? The Master tells you where they are. Got a technical problem? The Master tells you who to call. Can't figure out a part number? The Master tells you how the part number systems work.

There's more! The Master has a section on microprocessor development tools with complete performance parameters. There's another section on programmable logic devices giving you everything from output configuration to PLD development systems.

Want to know if there's an application note available on a given part? The Master tells you!

If your job has anything to do with integrated circuits, you need the IC Master. Subscribe now by calling (516)227-1314. Ask for Marie Botta. Tell Marie you need the Master now.

If you prefer, FAX Marie at (516)-227-1901. She'll FAX the IC Master subscription form back to you right away.

And, if you tell her you saw it in the 1993/94 EEM, she'll take $10 off the subscription price!

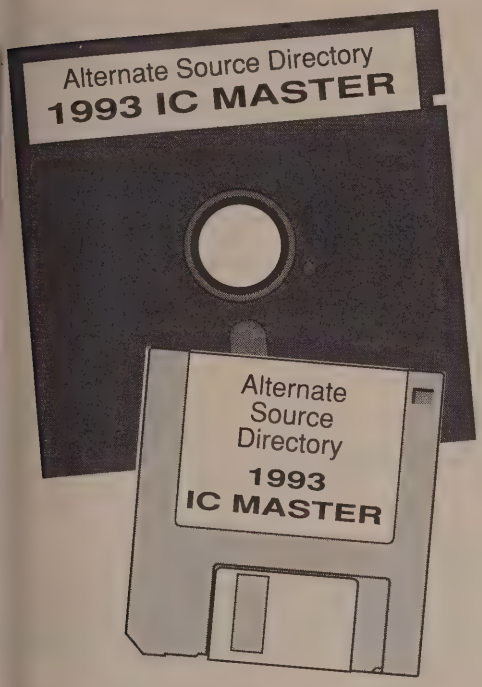
ICMASD

Alternate Source Directory



The all new 1993 ICMASD-IC Alternate Source Directory on Disk is identical to the Alternate Source Directory Section contained in Volume Two of the printed version of the 1993 IC Master. All you need is an IBM XT/AT or 100% compatible personal computer with hard drive.

ICMASD is the most comprehensive and reliable guide available to all ICs known to have a realistic replacement or alternative. The 1993 version contains over 106,000 listings to help you find the functional equivalents for both current and discontinued parts.

The electronic ICMASD is fast, convenient...and can be customized for your specific needs!

ENHANCED FLEXIBILITY

ICMASD is organized in a similar fashion to the printed version in the IC MASTER. The database is arranged by manufacturer, showing the manufacturer's original basic part number. All known replacements for that part are listed in alphanumeric order.

The enhanced flexibility of the electronic ICMASD allows you to add comments, up to 19 digits long, to any device listing in the system. These comments can be part numbers, project notes, prices, or any information unique to your application.

USER FRIENDLY

ICMASD is very user friendly. There are no tricky commands to learn. The software is completely menu driven. ICMASD comes complete with documentation that is brief and to the point. It can be ordered on five 51/4" double-sided, double-density disks OR on one 51/4" high-density disk OR on one 31/2" high-density disk.

Published annually in March

FAST AND CONVENIENT

ICMASD includes a complete Manufacturers & Distributors Directory listing the addresses and phone numbers of every manufacturer in the IC industry. With this complete directory any manufacturer or distributor is just a phone call away.

To order your 1993 ICMASD,

Over the past two decades, **Kappa** has optimized, packaged, and critically tested literally thousands of specific variations of several hundred different passive and hybrid delay lines: fixed tapped, continuously adjustable, and electrically trimmable (varactor-tuned) lines; over virtually the complete signal spectrum from control (subaudio), through audio, sonar, RF, HF, and a wide variety of pulse rates widths and duty cycles.

Typical design families include:

- PRECISION SONAR DELAY LINES (Series A) 500 µsec to 10^6 µsec ±1%; linear to ±0.05%.
- LOW DISTORTION LINES (Series D) Delay-to-Risetime Ratio: 50 max; Bandwidth: 50 MHz max
- MINIATURE CONTINUOUSLY VARIABLE DELAY TRIMMERS (Series TT) SIZE: 1/4 Cubic Inch; up to120 ns; resolution ≤0.25 ns.
- SUPER-η™ DELAY LINES (Series H) Embody New Design Principle Providing the Highest Efficiency yet Obtainable in Lumped-Constant Delay Lines.
- MINITRIM DELAY LINE (Series MT) Resolution Less Than .5 ns and Delay Ranges Up to 300 ns.
- VIDEO BROADCASTING DELAY LINES (Series BC) Widely used in the Most Demanding Color TV Applications in American and European Systems.
- TRANSPONDER/TACAN/DME (Series C) Designed to Meet the Requirements of MIL-D-23859 and to Withstand the Most Rigorous Military Environments.

Comments: The FN 670 series of two stage filters has been designed specifically for use with switch mode power supplies. It has been designed for extremely low leakage current (less than half a milliamp). Therefore, it will not be affected by the high peak current which results from switching power supplies.

Are you getting all you want from eem?

EEM/Electronic Engineers Master is **user**-named, **user**-driven, and **user**-sensitive.

You, the electronic engineer, are the individual the thousands of manufacturers represented in EEM are trying to reach. **You** are the reason hundreds of manufacturers place their data pages in EEM—so that **you can specify their product in your project.**

EEM wants to know:

- what's new
- what products you are looking for
- what you call them
- what are their basic parameters
- where do they belong in the EEM Product Sections

What kind of reference material/engineering aids will help you make your electronic component choices:

- glossaries
- nomographs
- charts
- product selection guides

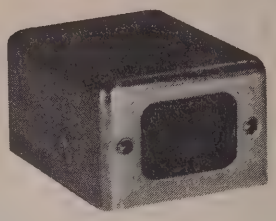
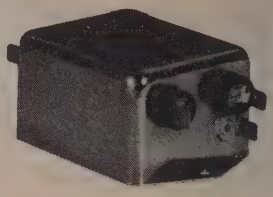
PA/PB SERIES

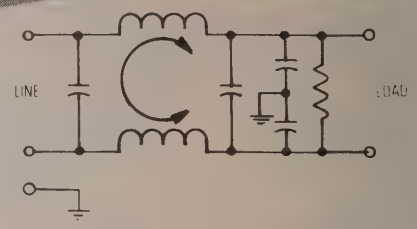




THE **TRI-MAG** PA/PB SERIES OF A.C. LINE FILTERS HAVE BEEN DEVELOPED PRIMARILY FOR COMPUTER SYSTEMS THAT USE SWITCHING POWER SUPPLIES. THE CURRENT RATINGS ARE HIGH ENOUGH TO ALLOW DESIGNERS TO PROTECT A COMPLETE COMPUTER SYSTEM FROM EXCEEDING THE CONDUCTED EMISSION LIMITS SPECIFIED EITHER BY FCC OR VDE.

THE PA IS AVAILABLE IN CURRENT RATINGS OF 1, 3, 5, 6 AND 10 AMPS AND THE PB IS AVAILABLE IN 1.3 AND 5 AMPS FOR OPERATION ON A.C. LINES OF 115 TO 250 VOLTS 50/60 Hz.

SPECIFY EITHER PA OR PB FOR THE CONDUCTED LIMITS THAT YOU WANT TO MEET.



Part No.	Current	Case	Leakage
PB1	1	2.5 × 2 × 1.5	1mA @ 250VAC
PB3	3	2.5 × 2 × 1.5	1mA @ 250VAC
PB5	5	2.8 × 2.0 × 1.5	1mA @ 250VAC

Rated Voltage: 250VAC, 47-63 Hz
Test Voltage: Line to Line: 1.5KVDC
Line to Gnd: 2.0KVAC

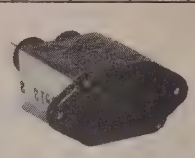
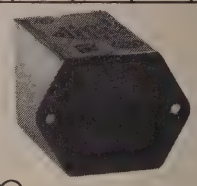
MPA/MPB SERIES





THE **TRI-MAG** MPA/MPB SERIES ARE THE "MINI" VERSIONS OF THE PA AND PB. THEY HAVE BEEN DEVELOPED TO SUPPRESS THE CONDUCTED EMISSIONS GENERATED BY SWITCHING POWER SUPPLIES. SINCE THESE SERIES ARE "MINI" IN SIZE AND COST, IT MAKES THEM IDEAL FOR COMPUTER PERIPHERALS.

THE MPA OR MPB IS AVAILABLE IN CURRENT RATINGS OF 2 AMPS FOR OPERATION ON A.C. LINES OF 115 TO 250 VOLTS, 50/60 Hz.

SPECIFY EITHER MPA OR MPB FOR THE CONDUCTED LIMITS THAT YOU WANT TO MEET.

FILTERS 1.0 MHz to 1.0 GHz

Eagle manufactures a wide variety of radio frequency filters. Our goal is to offer a wide variety of standard designs in order to ease the selection process and reduce costs to you the customer. In accordance with this goal the following unique approaches to RF filter manufacure have been taken.

Standard Frequency System-SFS™ Eagle has pioneered this in the filter industry. Basically SFS™ increments are by a fixed percentage. For example standard values would be 1.0 MHz, 1.2 MHz, 1.5 MHz rather then 1.0 , 2.0 , 3.0. As you can see by studying the cutoff frequencies this is identical as standard resistor values. Using this system as few as 46 cutoff frequencies blanket the spectrum from 1.0 MHz to 1.0 GHz. Experience has shown that 95% of the applications can use a standard filter rather than a custom design since a custom frequency can be no more then 5 % away from one of our standard frequencies..

Partially Assembled Module-PAM™ To insure quick delivery and maintain low costs Eagle has developed this concept. In this system the mechanical packages are designed for maximum flexibility both electrically and mechanically. Filter modules are partially assembled for each frequency group and installed into the proper enclosure. When an order is received the unit is trimmed to the final cutoff frequency resulting in a finished filter in days instead of weeks. Standard proven designs spare the customer of the unsurities and cost of custom units. Additionally, there are many standard, and stocked, values for each type of filter which are ready for 48 hour shipment.

Pricing-Eagle has the lowest prices for connectorized filters in low volumes. In 2-4 quantities the HLC700 lowpass filters begin at $95.20 for a standard frequency model. The tuneable filters are as low as $89.10 depending on the frequency range selected.

Due to limitations in space many filter types that are made by EAGLE are not listed here. Please write or call for the complete catalog of Eagle filters and other products.

HLC-700 Lowpass, Highpass, Bandpass and Bandstop Filters

HLC-700 Description:

Eagle HLC-700 series are compact, high performance filters. Stainless steel hardware and connectors assure that there is no corrosion due to galvanic potentials. Cases are solder sealed to keep out dust and foreign materials.

With minimum power ratings of 25 watts, and many models even higher, the spurious free dynamic range of these filters is tremendous. The filters are electrically very rugged, are resistant to ESD and EMP, and may be connected directly to antennas for receiver use or medium power transmitters.

HLC-700's are available in Lowpass, Highpass, Bandpass and Bandstop configurations. Lowpass and Bandpass filters are discussed on the following pages. Please request HLC-700 filter catalog for detailed specifications on Bandpass and Bandstop as well as complete information on Lowpass and Highpass filters.

EAGLE HLC700 enhanced chebychev low pass filters are available in four configurations: these are 7, 9, 11 or 13 sections. The enhanced chebyshev design yields a steeper transistion band with no increase in insertion loss. When used as signal filters these units offer excellent immunity from internal intermodulation due to the high power rating.

HLC72x Power Lowpass Filters

Features

- 36 Standard frequencies from 2.2 Mhz to 510 Mhz
- Two power ratings: 500 W or 1.0 KW
- Very low insertion loss: < 0.3 dB
- Sharp Cufoff: >50 dB @ 1.2 F_c

EAGLE HLC72x power filters are ideally suited for high power applications that require sharp cutoffs, small size and low loss. These filters are available in 9 or 11 sections. The proprietary topology yields sharpness approaching elliptical without generating the high internal voltages or currents normally associated with that topology.

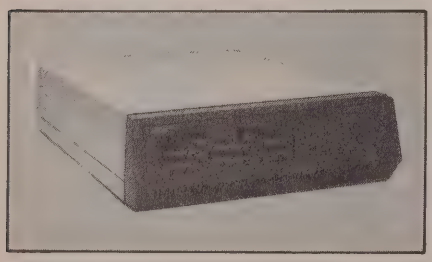
Our Model 9064 filter/amplifier system is an easy-to-use 64-Channel rack-mountable instrument with performance features far beyond its economical price.

The system is comprised of a mainframe and a wide selection of signal conditioning modules including filters, amplifiers, and oscillators.

Each mainframe holds up to 16 plug-in dual or quad channel cards that can be controlled from a remote computer over an RS-232 or IEEE-488 bus.

The 9064 provides an affordable, versatile, and convenient way to independently control the filtering and gain scaling of any multiple of 64 analog signal sources.

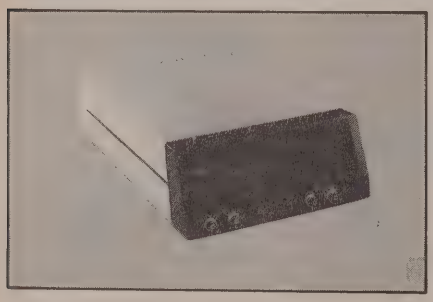
MODEL 9016 16-CHANNEL PROGRAMMABLE FILTER/AMPLIFIER SYSTEMS



FEATURES
- Local or remote programming
- Rack-mountable
- 3 1/2 digit frequency resolution, from 0.1 Hz to 102.4 KHz (optional 204.8KHz bandwidth)
- Gain/phase matched channels
- Selectable single-ended or differential input
- Pre/Post filter gain
- Non-volatile memory stores up to 8 set-ups per channel
- Wide variety of filter designs (see model 9064)

The Model 9016 is a 16-channel programmable filter instrument that allows you to amplify signals, and reject alias frequencies prior to recording or digitizing with unparalleled ease of use, versatility, and expandability. This multi-channel active filter features menu-driven set-up of each or every filter with five Command Function keys and a Help key. These keys provide convenient prompts that quickly and easily guide you through the configuration of the system.

MODEL 9002 DUAL-CHANNEL PROGRAMMABLE FILTER INSTRUMENTS



FEATURES
- Programmable via local keypad or remote computer
- IEEE-488 or RS-232 Interface
- 3 1/2 digit frequency resolution, from 0.1Hz to 102.4KHz (optional 204.8KHz bandwidth)
- Selectable single-ended or differential input
- Gain/phase matched channels
- Non-volatile memory stores up to 8 setups per channel
- Programmable AC/DC coupling
- High resolution pre-post filter gain
- Dimensions: 3.5"H x 8.5"W x 17"D

The Model 9002 is a dual-channel programmable filter instrument that offers more high performance features than any other comparable instrument. Both channels are independently tunable from 0.1 Hz to 102.4 KHz with an optional 204.8KHz range. The 9002 also provides a broader range of filter types than higher priced models and is mountable in half a standard 19" rack assembly. The 9002 dual-channel filter instrument proves that good filters come in small packages.
